1 Disclaimer

Before using the products described in this manual be sure to read and understand all respective instruction.

The ARRI ALEXA is only available to commercial customers. The customer grants by utilization that the ARRI ALEXA or other components of the system are deployed for commercial use. Otherwise the customer has the obligation to contact ARRI preceding the utilization.

While ARRI endeavors to enhance the quality, reliability and safety of their products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risk of damage to property or injury (including death) to persons arising from defects in the products, customers must incorporate sufficient safety measures in their work with the system and have to heed the stated canonic use.

ARRI or its subsidiaries do not assume any responsibility for incurred losses due to improper handling or configuration of the camera or other system components, due to sensor contamination, occurrence of dead or defective pixels, defective signal connections or incompatibilities with third party recording devices.

ARRI assumes no responsibility for any errors that may appear in this document. The information is subject to change without notice.

For product specification changes since this manual was published, refer to the latest publications of ARRI data sheets or data books, etc., for the most up-to-date specifications. Not all products and/or types are available in every country. Please check with an ARRI sales representative for availability and additional information.

Neither ARRI nor its subsidiaries assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of ARRI products or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property right of ARRI or others.

ARRI or its subsidiaries expressly exclude any liability, warranty, demand or other obligation for any claim, representation, or cause, or action, or whatsoever, express or implied, whether in contract or tort, including negligence, or incorporated in terms and conditions, whether by statute, law or otherwise. In no event shall ARRI or its subsidiaries be liable for or have a remedy for recovery of any special, direct, indirect, incidental, or consequential damages, including, but not limited to lost profits, lost savings, lost revenues or economic loss of any kind or for any claim by third party, downtime, good-will, damage to or replacement of equipment or property, any cost or recovering of any material or goods associated with the assembly or use of our products, or any other damages or injury of the persons and so on or under any other legal theory.

In the case one or all of the foregoing clauses are not allowed by applicable law, the fullest extent permissible clauses by applicable law are validated.

ARRI is a registered trademark of Arnold & Richter Cine Technik GmbH & Co Betriebs KG.

Note: This product and the accessories recommended by the manufacturer fulfill the specifications of the European Directive 2004/108/EC (15th December 2004).
The ALEXA viewfinder EVF-1 contains proprietary technology owned by Fourth Dimension Displays Limited and licensed by ARRI.

This product contains licensed technology from Linotype.

Quicktime and Quicktime logo are trademarks or registered trademarks of Apple Computer, Inc., used under license therefrom.

Apple ProRes 422 (Proxy), Apple ProRes 422 (Lt), Apple ProRes 422, Apple ProRes 422(Hq), Apple ProRes 4444 and the ProRes logo are trademarks or registered trademarks of Apple Computer, Inc., used under license therefrom.

SxS and Sxs are trademarks of SONY corporation.

Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.

Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

THIS SOFTWARE IS PROVIDED BY THE AUTHOR(S) “AS IS” AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE AUTHOR(S) BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

This product meets CE regulations.
2 Scope

This instruction manual applies to the following hardware, software and firmware versions:

ARRI ALEXA, ARRI ALEXA Plus, ARRI ALEXA Plus 4:3, ALEXA M with ARRI EVF-1 electronic viewfinder;
ARRI ALEXA Studio with optical viewfinder or ARRI EVF-1 electronic viewfinder:
- Camera software update packet (SUP): 7.0
- EVF-1 software packet: 1.34

3 What's new in 7.0

This chapter gives an overview of what has changed with SUP 7.0.

Equipment/Accessories Supported

CLM-4 Support

All ALEXA models with integrated motor drivers for ARRI Controlled Lens Motors will support the compact and powerful CLM-4 in addition to CLM-2 and CLM-3. As for CLM-3, the motor torque is adjustable for smoother operation of lens rings with more resistance.

Imaging

Sensor Readout Size for ProRes 2K Recording (see Chapter SxS Cards on page 87)

When the camera is switched from HD to 2K resolution in-camera recording, the size of the captured frame changes slightly. This is necessary so that the de-bayering can work with an optimized downscale factor and deliver the best possible 2K image quality.

- Recording ARRIRAW 16:9, HD-Video, ProRes HD and DNxHD uses 2880 x 1620 photosites with a frame size of 23.76 x 13.365 mm
- ProRes 2K 16:9 uses 2868 x 1612 photosites (23.661 x 13.299 mm)
- ARRIRAW 4:3 uses 2880 x 2160 photosites (23.76 x 17.82 mm)
- ProRes 2K 4:3 uses 2868 x 2150 photosites (23.661 x 17.738 mm)

When recording ARRIRAW and ProRes 2K in parallel, it is important to note that the ARRIRAW frame holds a few more columns and lines of pixels. This is taken into account in the latest release of the ARRIRAW SDK, where the user can select which ARRIRAW frame size will be used to create a 2K image.

Image Processing/Look Files

New Standard Speed De-bayering Algorithm

ADA-3 HW, a new and improved de-bayering and downscale algorithm is now available for all ALEXA models. The new algorithm produces cleaner high contrast edges and crisp fine detail, which results in sharper images. The camera uses ADA-3 HW for HD-SDI, ProRes and DNxHD output at up to 60 fps.

Note: The ARRIRAW Converter and ARRIRAW SDK additionally provide ADA-3 SW, a more sophisticated software version of the new algorithm.

New High Speed De-bayering Algorithm
The High Speed de-bayering algorithm provides the same overall image characteristics as the regular speed de-bayering algorithm. The new version improves the rendition of flat color fields and delivers a cleaner overall image. It is used for HD-SDI monitoring and ProRes or DNxHD output from 60 to 120 fps.

Note: In certain situations, saturated objects with little or no texture may exhibit a faint checkered pattern in the red and blue color channel. This artifact was clearly visible in the previous SUP release and is now considered to be reduced to a degree where it does no longer pose a problem.

Low Contrast Curve (see Chapter ARRI Look Files on page 70)
The LCC ARRI Look File is now part of the SUP. It is always available in the camera menu, even after a factory reset.

SxS Onboard Recording

ProRes 2K recording (see Chapter SxS Cards on page 87)
Recording 2K resolution to the camera storage module is only possible in one of the QuickTime ProRes codecs. ProRes recording in HD and 2K resolution put very similar requirements on the recording media. A 64 GB SxS Pro card allows recording up to 60 fps in 16:9 aspect ratio and up to 48 fps in 4:3 aspect ratio. It will hold approximately 19 minutes of ProRes 2K 4:3 and approximately 25 minutes in 16:9. ProRes 2K recording is not available in High Speed mode.

Outputs

MON OUT clone (see Chapter REC OUT on page 90)
The REC OUT output can optionally be configured to show a cloned output from the MON OUT output. This is the only mode available in High Speed mode since SUP 6.1 and can now optionally be activated for all other sensor and recording resolution configurations in regular speed mode.

The MON OUT clone option can be found at MENU > Recording > REC OUT > HD-SDI format.

Electronic Viewfinder and MON OUT

Redesign of Status Display on EVF and MON OUT (see Chapter Status Info Overlays on page 128)
The status display in the electronic viewfinder and the MON OUT image has been redesigned.

- New icons indicating SxS recording resolution, screen grab, RET IN active, settings for MON OUT and EVF, application of ARRI Look File
- In 16:9 sensor mode, the camera image is scaled to fit inside the status info border
What's new in 7.0

- In 4:3 sensor mode, a few lines on top and bottom of the camera image are covered by translucent status info bars.
- The electronic horizon, the LDS info and reel and clip number, when active, extend into the camera image in all sensor modes.

**ARRI 1.85 2K DCI Frame Lines (see Chapter Frame Lines on page 125)**

The frame size of a 2K DCP container is 2048 x 1080 pixels. A DCI-compliant 2K image with 1.85:1 aspect ratio has a resolution of 1998 x 1080 pixels. When recording ProRes 2K, it is therefore necessary to either scale down the recorded image to get to the DCI size, or to crop it from the frame.

ALEXA offers frame lines called ARRI 1.85 2K DCI. These were created to show the proper framing when a 2K 1.85:1 DCI image shall be cropped from the captured image.

**Metadata and Time Code**

**External Time Code**

The camera will no longer REGEN or JAM time code while it is recording, as this is suspected to have caused single underexposed frames.

**Lens Metadata**

The lens metadata is now recorded as both raw lens encoder information and interpreted LDS information.

**Remote Control**

**3D on ALEXA M**

3D sync features are now available without license key on all ALEXA M cameras.

**User Interface**

**GUI Homescreen and Menus Updates (see Chapter Main Controls on page 54)**

- Sensor mode (16:9 and 4:3), SxS/ProRes recording resolution and remaining recording time are now indicated on the camera menu's home screen.
- The color settings "DCI P3" and "Film Matrix On" were removed.
- "Vari Flag" and "SDI Rec Flag" were removed as options and are now permanently enabled.
- The "Electronic level" option was renamed to "Electronic horizon".
- The "Tropical" sensor temperature setting was renamed to "High humidity".
- A progress bar now indicates the remaining time for switching between regular and high speed mode.
- The WNA-1 menu was removed.
- The RUN beeper indicates when the camera has reached speed.

...
- The Project menu was extended to show sensor mode (16:9 or 4:3), SxS resolution (2K or HD) in addition to active codec, project frame rate, camera index, next reel count and production info.
- It is now possible to enter upper- and lower case characters for all user-created items (e.g. user setup).
- One additional USER button. Pressing the jog wheel opens the edit menu.
- New USER button options for:
  - MON OUT look
  - EVF look
  - Color bars on MON OUT and REC OUT
  - Grab GUI to store a .png of the current menu screen (use operator side buttons 1-3)
  - Mirror shutter to leave the shutter spinning or stop in VIEW or GATE position when stopping the recording (ALEXA Studio only)
4 Introduction to the ALEXA

The ALEXA is a 35mm-format, film-style digital camera made by ARRI, the world leader in professional cinematographic imaging. It combines leading-edge digital technology with film-camera features that have been refined over more than 90 years of ARRI history. The result is a camera that allows cinematographers with a film background to shoot digitally without the need for extensive training.

People who are used to shoot digitally will experience a camera like they never did before, providing more powerful features than in any other camera available today.

Handling

The camera is a true ARRI. It has a high-precision integrated housing with an ergonomic design. It is rugged, reliable, flexible and sealed to make it splash-proof. It also has mounting points for accessories, as ALEXA integrates well with existing ARRI accessories. In addition, a new range of accessories specifically designed for ALEXA is available.

Operation

ALEXA features a unique user interface, designed to make camera operation easier than ever, while giving easy access to a large number of controls.

There are three different control interfaces:

- The main user interface on the right side gives access to every camera parameter through a graphical display and a button panel.
- The operator user interface on the left side for basic control, adjustable to the operator's individual needs by supplying assignable buttons in addition to function buttons.
- The viewfinder user interface for adjusting the most important image parameters with buttons on the viewfinder and the interface graphics overlayed to the viewfinder image.

Power management

The camera accepts any input voltage from 10.5-34 V DC. Different power sources can be connected to the camera simultaneously. The camera's power management ensures that the power source with the highest voltage level is used. Power sources are hot-swappable to minimize the risk of sudden power loss.

ALEV III sensor

The ALEV III sensor has a horizontal pixel count of 3.5K resulting in true 2K resolution. It covers the full Super-35 format and it provides a latitude of 14 stops and a base sensitivity of 800 ASA.
The sensor temperature is kept stable by a Peltier element to ensure optimum image quality under all operating conditions.

AIT - ARRI Imaging Technology

ARRI imaging technology ensures the most organic, film-like image quality of any digital camera with natural color rendition and pleasing skin tones.

Thermal concept

The camera electronics are fully sealed to protect them from dirt and moisture. Camera heat is transported via heat pipes to a radiator which is cooled by a fan. The fan itself is very silent, so the camera noise level is below 20 dB (A)* - this is the same as with ARRI sync-sound film cameras. If the fan noise level starts to increase due to fan aging, the fan can be swapped in a matter of minutes by a trained technician.

*at 24 fps and ambient temperature < 25°C

EVF-1 electronic viewfinder

ARRI is redefining electronic viewfinders with LED lighting, high resolution and a viewing experience that comes as close to an optical viewfinder as possible.

Internal recording

ALEXA can internally record Quicktime movie clips with Apple ProRes™ or MXF files with AVID DNxHD codecs to Sony SxS PRO cards. The cards deliver high data rates and are very robust. ProRes™ can be natively edited in Apple FinalCutPro, eliminating the need to transcode. ProRes 422 (HQ) and ProRes 4444 deliver visually lossless compressed images with a color depth of 10 bit for ProRes 422 and 12 bit for ProRes 4444. DNxHD can be natively edited in AVID MediaComposer without transcoding. Quicktime movie clips and and MXF files can be played back in the camera with output on REC OUT, MON OUT and the electronic viewfinder.

Audio recording

Analog 2-channel audio can be recorded as 24 bit 48 kHz PCM in the Quicktimes, as well as embedded to the HD-SDI signals.

Licensed features

By adding license keys, new camera features can be enabled that go beyond the initial camera specification.
High speed image capture

In Regular Speed mode, ALEXA has a frame rate range from 0.75 to 60 fps. By adding a license key for High Speed mode, the frame rate range of the camera can be extended up to 120 fps.
4.1 About This Manual

ARRI recommends that all users of the ALEXA read the manual in its entirety prior to use. For experienced users, the manual's structure also provides quick access for reference.

In this manual:

- Layout of the ALEXA
- Safety Guidelines
- General Precautions
- Power Supply
- Camera Support
- Connectors
- Lens Mounting
- User Interface
- Operation of the ALEXA

How to Use This Manual

All directions are given from a camera operator's point of view. For example, camera-right side refers to the right side of the camera when facing toward the front of the camera.

Connectors are written in all capital letters, for example, REC OUT. Menus and screens on the Main Camera Controls are written in all capital letters, for example, RECORDING menu and HOME screen. Buttons are written in bold typeface capital letters, for example, PLAY button.

The appendix at the back of the manual contains useful reference material including ALEXA specifications, connector pin-out diagrams, a false color display explanation, error and warning message explanations, ALEXA dimensional drawings and a menu structure tree.

6 Safety Guidelines

Any violation of these safety instructions or non-observance of personal care could cause serious injuries (including death) to users and affiliates and damage to the equipment or other objects.

6.1 Explanation of Warning Signs and Indications

⚠ Indicates a possible risk of injury or damage to the equipment

⚠⚡ Indicates the risk of electric shock or fire danger that could result in injury or damage to the equipment.

Note: Indicates further information or information from other instruction manuals

6.2 General Safety Guidelines

⚠⚠⚡

- Always follow these guidelines to ensure against injury to yourself or others and damage to the system or other objects.
- This safety information is in addition to the product specific operating instructions in general and must be strictly observed for safety reasons.
- Read and understand all safety and operating instructions before you operate or install the system!
- Retain all safety and operating instructions for future reference.
- Heed all warnings on the system and in the safety and operating instructions before you operate or install the system. Follow all installation and operating instructions.
- Do not use accessories or attachments that are not recommended by ARRI, as they may cause hazards and invalidate the warranty!
- Do not attempt to repair any part of the system! Repairs must only be carried out by authorized ARRI Service Centers.
6.3 Specific Safety Instructions

- Do not remove any safety measures from the system!
- Do not operate the system in areas with humidity above operating levels or expose it to water or moisture!
- Do not cover the fan openings at the camera back top and bottom!
- Do not subject the system to severe shocks!
- Do not place the system on an unstable trolley/hand truck, stand, tripod, bracket, table or any other unstable support device! The system may fall, causing serious personal injury and damage to the system or other objects.
- Operate the system using only the type of power source indicated in the manual! Unplug the power cable by gripping the power plug, not the cable!
- Never insert objects of any kind into any part of the system if not clearly qualified for the task in the manual, as objects may touch dangerous voltage points or short out parts! This could cause fire or electrical shock.
- Unplug the system from the power outlet before opening any part of the system or before making any changes to the system, especially the attaching or removing of cables!
- Do not use solvents to clean!
- Do not remove any stickers or paint marked screws!
- Always place a lens or a protective cap in the lens mount receptacle!
- Never run a camera with a mirror shutter without a lens or a protective cap in the lens mount receptacle!
- Changing camera lenses should be done in a dry and dust-free environment. If this is not possible, take extra care that no dust enters the camera while the lens is off!
- When no lens is attached to the camera, immediately place the protective on the lens mount to avoid contamination of the sensor cover glass!
- After changing lenses, always perform a dust check to make sure no dust has settled on the sensor cover glass!
- Clean optical lens surfaces only with a lens brush or a clean lens cloth. In cases of solid dirt or grease, moisten a lens cloth with pure alcohol. Discard contaminated lens cloth after use! Never attempt to clean a lens brush with your fingers!
- NEVER USE CANS WITH COMPRESSED AIR OR GAS TO BLOW OFF THE DUST! This can severely damage optical elements.
- If the sensor cover glass has been contaminated by solid dirt or grease, special optical cleaning kits should be used for dirt removal under very high care! If the contamination cannot be removed, the camera should be taken to an ARRI service center for cleaning.
- THE USE OF METHANOL TO CLEAN OPTICAL SURFACES IS NOT RECOMMENDED!
- NEVER USE ACETONE TO CLEAN OPTICAL SURFACES!
- NEVER TRY TO REMOVE THE SENSOR COVER GLASS!
- DO NOT POINT THE CAMERA INTO DIRECT SUNLIGHT, VERY BRIGHT LIGHT SOURCES, OR HIGH-ENERGY LIGHT SOURCES (e.g. laser beams)! This may cause permanent damage to the camera image sensor.
- DO NOT POINT THE VIEWFINDER INTO DIRECT SUNLIGHT, VERY BRIGHT LIGHT SOURCES, OR HIGH-ENERGY LIGHT SOURCES (e.g. laser beams)! This may cause permanent damage to the viewfinder display and optical elements.
7 General Precautions

7.1 Storage and Transport

- Use a lens port cap to prevent damage to the sensor cover glass and sensor whenever there is no lens attached.
- Unplug all cables when transporting the Alexa in a camera case.
- Do not store the camera in places where it may be subject to temperature extremes, direct sunlight, high humidity, severe vibration, or strong magnetic fields.

7.2 Electromagnetic Interference

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

Complies with the canadian ICES-003 Class A specifications. Cet appareil numérique de la Classe A est conformé à la norme NMB-003 du Canada.

This device complies with RSS 210 of Industry Canada. This Class A device meets all the requirements of the Canadian interference-causing equipment regulation. Cet appareil numérique de la Class A respecte toutes les exigences du Règlement sur le matériel brouilleur du Canada.

7.3 Condensation

⚠️ ⚠️ ⚠️

When moving the camera from a cool to a warm location or when the camera is used in a damp environment, condensation may form inside the lens port, on the sensor cover glass, between the sensor and the sensor cover glass, and on internal or external electrical connections.
• Operating the camera while condensation is present may result in personal injury or damage to the equipment.

Condensation on the optical components may have a visible effect on the output images. To reduce the risk of condensation:

• Find a warmer storage location.
• Attach the ARRI air-drying cartridge (silica bottle) to the PL-Mount of the camera during storage
• Note: Do NOT leave the air-drying cartridge attached to the PL-Mount during transportation of the camera!
• If camera needs to be stored in a place that is considerably cooler than the location where it will be used, consider keeping the camera powered from a mains unit in addition to using the air-drying cartridge.
• In ambient temperatures above 30°C/86°F and/or humidity above 60%, always attach the air-drying cartridge to the PL-Mount of the camera when not in use. This not only applies to storage, but also to shooting breaks and situations when the camera remains without an attached lens for an extended time.
• MAKE SURE THE SILICA BOTTLE IS SECURELY FASTENED. UNDER NO CIRCUMSTANCES SPILL SILICA INTO THE LENS PORT!
8 Power Supply

⚠️
- Use only ARRI-recommended power supply solutions.
- Manipulation of power supplies could result in serious injury or death, or damage to the ALEXA.

The ALEXA accepts an input voltage range from 10.5 to 34 V DC. The camera can be powered through the BAT connector or battery adapters accepting V-Lock or Gold Mount batteries.

The power supply should deliver an output of more than 90 W to power the camera sufficiently. The power draw of the camera in basic configuration is about 85 W.

A 12 to 15 V battery should have at least 6 A maximum output current.

---

Note: when powering accessories through the camera, the total power draw of the camera is increased by the amount of power drawn by the accessories.

8.1 Power Management

When using the BAT connector and one or more onboard battery adapters simultaneously, the camera’s power management system ensures that the power source with the highest voltage level is used. When the voltage level of one power source drops below the level of the other, or a power source is disconnected from the camera, the power management system automatically switches to the other power source, avoiding shutdown of the camera.

For example, a 12 V onboard battery can be used as backup for the main 24 V battery. Using a 12 V onboard battery in addition to the main 24 V battery also allows for quick switchover to handheld mode—the power cable can simply be disconnected from the BAT connector.

When using two onboard battery adapters (with batteries in parallel—one on top and one on the back), the camera will treat them as a single source. When used this way, the load is spread across two batteries, creating a strong power source.

8.2 BAT Connector

The BAT connector is the primary power input on the ALEXA. It is a Fischer 2-pin socket located at the back of the camera on the camera-right side.
The socket accepts power cables KC-20S and KC-29S. The cables can either be connected to the mains unit NG 12/26R or to 24 V cine-style batteries with three-pin XLR outputs.

Figure 7: BAT connector

8.3 Mains Unit NG 12/26 R

Use of the mains unit is recommended for shooting in the studio and when using electronic accessories with high power consumption.

To power the ALEXA using the Mains Unit NG 12/26 R:

1. Set the correct mains voltage on the mains unit using the fuse on the back of the unit. For example, set it to 220 V if the AC mains power source is 220 V.
2. Connect the mains unit to AC mains power.
3. Ensure that the camera power is turned off.
4. Set the voltage switch on the mains unit to 26 V.
5. Connect the battery cable KC-20S or KC-29S (spiral cable) to the power supply socket on the camera and the 26 V socket on the mains unit.

Note: The NG 12/24 R was the original design that provided 12 & 24 volts output – it was superseded by the NG 12/26 R, which outputs 12 & 26 volts. The NG 12/24 R can easily be upgraded to NG 12/26 R specification at an ARRI service center.

8.4 Cine-Style Batteries

Any 24 V cine-style battery with a three-pin XLR output can be used to power the camera through a KC-20S or a KC-29S.

The Anton/Bauer CINE VCLX/2 battery (280 Wh) with charger is available from ARRI.
To connect the battery to the camera:

6. Ensure that the main switch on the camera is off.
7. Connect the battery cable KC-20S or KC-29S (spiral cable) to the power supply socket on the camera and the 28V output on the battery.

Note: When the battery voltage drops below the warning level, the BAT1 level in the camera display will start flashing. A white i will appear, signaling more information is available on the INFO screen. For more information on setting the low battery warning level, see Menu>System>Power (on page 102).

To charge the battery

1. Connect the charger to AC mains power.
2. Plug the charger cable into the charge input socket of the battery.
3. Charge the battery until complete. Fully charged batteries can be left connected to the charger until required for shooting.

Note: For more information, refer to the Anton/Bauer CINE VCLX/2 manual.

8.5 Onboard Batteries

The camera can be equipped with adapters for either V-Lock or Gold Mount video-style batteries. When a battery equipped with the TI-protocol for battery communication is used, the ALEXA will display remaining capacity as a percentage on the Home screen. For these batteries, the user does not need to set the battery warning level.

Four different adapters are available:

- BAB-G: Back-mount adapter Gold Mount batteries
- BAB-V: Back-mount adapter V-Lock batteries
- BAT-G: Top-mount adapter Gold Mount batteries
- BAT-V: Top-mount adapter V-Lock batteries

Note: Adapters must be installed by a trained technician!

8.5.1 V-Lock Batteries

V-Lock batteries from different manufacturers may be used on the ALEXA. When batteries from manufacturers such as ID-X and Bebop, are used, their remaining capacity will be displayed as a percentage on the Home screen.

To attach a V-Lock battery:

1. Align the v-shaped wedge on the battery with the v-shaped notch on the battery plate.
2. Press the battery downwards until you hear a click.
3. Check that the battery is securely mounted on the battery plate.

To release a V-Lock battery:
1. Press the release button on the camera-left side or top of the battery (manufacturer dependent).
2. While pressing the release button, slide the battery upwards.

Figure 8: ALEXA with BAB-V and V-Mount battery

Note: Not all V-Lock batteries deliver enough power to supply the camera. Use only batteries with a capacity of 90 Wh or more to prevent damage to the battery and unpredictable camera behavior. Any camera-battery combination should be tested prior to use, especially when accessories are powered through the camera.

8.5.2 Gold Mount Batteries

If the ALEXA is equipped with a Gold Mount, Anton/Bauer batteries can be used. Their remaining capacity will be displayed as a percentage on the Home screen.

To attach a Gold Mount battery:
1. Align the three pins on the back of the battery to the three corresponding holes on the battery plate.
2. Press the battery to camera-right until you hear a click.
3. Check that the battery is securely mounted on the battery plate.

To release a Gold Mount battery:

1. Press the release button on the camera-left side of the battery plate.
2. While pressing the release button, slide the battery camera-left, and pull it straight out.

*Figure 9: Camera with BAB-G and a Gold Mount battery*

Note: Not all Gold Mount batteries deliver enough power to supply the camera. Use only batteries with a capacity of 90 Wh or more to prevent damage to the battery and unpredictable camera behavior. Any camera-battery combination should be tested prior to use, especially when accessories are powered through the camera.
8.6 Power Outputs

The ALEXA has two 24 V power outputs and one 12 V power output for accessories. ALEXA Plus, ALEXA Plus 4:3 and ALEXA Studio models have three 24 V power outputs and one 12 V power output.

![Figure 10: 24 V outputs (RS) and 12 V output](image)

8.6.1 Powering 12 V Accessories

One 12 V output with a 2-pin LEMO connector is located on the right side of the camera. It is limited to 12 V and can supply a device with a current of up to 2.2 A, depending on the camera power supply.

8.6.2 Powering 24 V Accessories

Two 24 V remote start/stop (RS) outputs with 3-pin Fischer connectors are located on the right side of the camera. They can supply two devices with a combined load of up to 2.2 A (shared with the EXT connector power out), depending on the camera power supply. When the camera is powered from a source with a voltage below 24 V, they output 24 V. If the camera's power source supplies more than 24 V, this voltage level is also present on the RS outputs.

Besides powering accessories, the RS outputs can also be used to send a remote start/stop signal to the camera.
9 Camera Support

9.1 Minimum Equipment Recommended For Operation

- ARRI ALEXA camera body including SxS module and Lens Adapter PL mount without LDS (LA-PL-1)
- EVF-1 Electronic Viewfinder
- VMB-1 Viewfinder Mounting Bracket
- KC 150-S Viewfinder Cable short 0.35m/1.2ft
- CCH-1 Center Camera Handle
- BP-12 Bridge Plate with base plate, or BPA-1 with BP-5/BP-8 Bridge Plate and base plate, or WA-1 Wedge Adapter and Quick Release HD Baseplate
- SD card
- Compatible power supply
- Sony SxS PRO card for recording

9.2 Tripod and Remote Heads

Tripod and remote heads must have adequate load ratings to support the ALEXA and attached accessories. See the following table for camera and component weights.

<table>
<thead>
<tr>
<th>Camera weight</th>
<th>lbs</th>
<th>kg</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARRI ALEXA incl. SxS module, EVF-1, VMB-1, CCH-1, KC-150S</td>
<td>16.85</td>
<td>7.65</td>
</tr>
<tr>
<td>ALEXA camera body including SxS module</td>
<td>13.79</td>
<td>6.26</td>
</tr>
<tr>
<td>Electronic Viewfinder EVF-1</td>
<td>1.65</td>
<td>0.75</td>
</tr>
<tr>
<td>Viewfinder Mounting Bracket VMB-1</td>
<td>0.55</td>
<td>0.25</td>
</tr>
</tbody>
</table>

Note: Always check the payload limits of a remote head and crane before mounting a camera.

In applications where the camera mount is subject to high forces (e.g. car or helicopter mounts) the camera must be additionally secured with appropriate safety restraints. All mount screws must be tightened firmly with an appropriate screwdriver (not with the commonly used coin!).
9.3 Electronic Viewfinder EVF-1

The electronic viewfinder EVF-1 employs a liquid crystal on silicon (LCOS) imaging device with a temperature-stabilized LED light source to provide a bright, accurate view of the sensor image in all operating conditions. Each EVF-1 is calibrated to precisely match the image on the ALEXA's HD outputs.

The EVF-1 has a resolution of 1280x720 pixels, with 32 additional lines of resolution above and 32 below the image to display camera status information. The EVF-1 can also display a 10% surround view area of the sensor to help the operator track unwanted elements before they enter the recorded image area. Focus can be checked by temporarily zooming into the image with a magnification factor of 2.25x. The low-latency interface of the EVF-1 has a delay of less than 1 frame.

The EVF-1 has button controls for false color check and zoom, as well as buttons and a jogwheel to control EVF and camera settings.
Connect the viewfinder to the camera using the viewfinder mounting bracket VMB-1.

![Camera with EVF-1](image)

*Figure 11: Camera with EVF-1*

---

Note: Do not point the viewfinder eyepiece at direct sunlight or bright light sources, as this could damage the LCOS imaging device. If possible, cover the eyepiece when not in use to prevent any damage.

---

### 9.3.1 Viewfinder Cables

The viewfinder cables are unidirectional with a male plug to connect to the camera and a female plug to connect to the viewfinder.

Cables are available in the following lengths:

<table>
<thead>
<tr>
<th>Model</th>
<th>Length (m / ft)</th>
<th>Suggested use</th>
</tr>
</thead>
<tbody>
<tr>
<td>KC-150-S</td>
<td>0.35 / 1.2</td>
<td>For use of EVF-1 on camera left side in handheld mode</td>
</tr>
<tr>
<td>KC-151-S</td>
<td>0.65 / 2.1</td>
<td>For use of EVF-1 on camera right side or when using Viewfinder Extension Bracket VEB-1</td>
</tr>
<tr>
<td>KC-152-S</td>
<td>2.00 / 6.6</td>
<td>Longest possible length for use with specialty rigs</td>
</tr>
</tbody>
</table>
9.3.2 Viewfinder Mounting Bracket

The Viewfinder Mounting Bracket VMB-1 / VMB-2 is attached to the camera using two captive 3mm hex socket head screws on top of the camera at the front. Attach the EVF-1 to the Viewfinder Mounting Bracket by sliding the dove tail into the receptacle and closing the lever on the EVF-1.

The position of the EVF-1 can be adjusted by loosening the levers on the Viewfinder Mounting Bracket, adjusting the position as desired and closing the levers to retighten.

The EVF-1 can be mounted on the camera-right side by unscrewing the threaded end cap on the side-to-side adjustment rod, removing the rod itself and inserting it from the other side. Remember to reattach the threaded end cap.

Note: Camera-right operation is not possible with the standard EVF cable KC-150-S. Instead, the longer cable KC-151-S is needed.
The Viewfinder Extension Bracket VEB-1 extends the mounting point of the EVF-1 further back. It can be attached to a tripod head for use with geared heads or greater comfort when using fluid heads using its standard attachment point for the ARRI Eyepiece Leveler EL-3. To avoid damage to the VMB-1/VMB-2 when using the VEB-1 with an eyepiece leveler, loosen the friction on VMB-1/VMB-2's rotating assembly.

Figure 14: EVF extension bracket

Figure 15: Camera with EVF-1 on extension and cable KC-151S
9.4 Center Camera Handle CCH-1

The Center Camera Handle CCH-1 is attached to the camera top with three captive 3mm hex socket head screws (two at the front and one at the back). Ensure that the CCH-1 is securely fastened before attempting to lift the camera from it.

Figure 16: Camera with CCH-1, side view
The Handle Extension Block HEB-2 mounts to the front end of the CCH-1 and adds one more focus hook to the camera in a high position, allowing the tape measure to clear the matte box.

9.5 Side Camera Handle SCH-1

The Side Camera Handle SCH-1 is used in conjunction with a BAT-V or BAT-G top-mounting battery adapter, or with third-party onboard recorders. It is attached to the camera using three captive 3mm hex socket head screws (two at the front and one at the back). Ensure that the SCH-1 is securely fastened before attempting to lift the camera from it.

If a tall battery or a tall third-party onboard recorder is used, the adjustable center grip of the SCH-1 can be replaced by the taller Adjustable Center Grip Tall (ACG-2).
The bridge plate BP-12 for 19 mm studio rods has been newly developed for ALEXA. It mounts directly to the camera body using two 3/8”/16 screws and ensures that support rods, matte boxes and follow focus units are positioned properly in regards to the optical center of the camera, just like all other ARRI cameras.
The bridge plate BP-13 is equivalent to the BP-12, but for 15 mm studio rods.

Note: Make sure bridge plates are tightened firmly with a screwdriver, not the commonly used coin!

9.7 Bridge Plate adapter BPA-1

The bridge plate adapter BPA-1 can be used to attach a BP-3/BP-5/BP-8/BP-9 to ALEXA. First attach the BPA-1 to the camera with the two screws. Then attach the bridge plate to the adaptor with its two screws. Make sure the screws are tightened firmly with a screwdriver.
9.8 Wedge Adapter WA-1 and Quick-Release Plate QR-HD-1

The WA-1 can be mounted at the same position as a bridge plate. It has a dove tail that slides into the counter part of a quick-release plate, like the ARRI QR-HD-1. The quick-release plate has a pin at its back, which fits into the pin receptacle at the back of the camera base.

![Figure 19: ARRI QR-HD-1](image)

9.9 Leveling Block LB-1

The Leveling Block LB-1 attaches to the bottom of the ALEXA in the pin receptacle on the back foot. It prevents the camera from resting on a rear-mounted battery when a bridge plate is attached and the camera is placed on a flat surface.

Attach the LB-1 by inserting its pin into the pin receptacle at the end of the shoulder arc in the camera base. Twist the knob clockwise to tighten.

![Figure 20: Leveling Block LB-1](image)
9.10 Shoulder Pad SP-3

The camera base has an integrated arch to fit to the operator's shoulder. For extended handheld shots, the newly designed shoulder pad SP-3 can be attached to the base of the camera with velcro.

Note: The SP-3 can only be used with a BP-12 and 19 mm rods or with 15 mm rods and a Wedge Adapter WA-1 and a Quick-Release Plate QR-HD-1. When using the BPA-1 with a BP-5/BP-8, the bridge plate has to be removed prior to attaching the SP-3.

Figure 21: SP-3 shoulder pad

Camera front

Figure 26: Camera front

EVF connector
10.1 BAT

The BAT connector can be used to power the camera from an external power source with cables KC-20S and KC-29S.

It is located at the back of the camera on the camera-right side.

10.2 REC OUT 1 + 2

The REC OUT consists of two BNC connectors capable of carrying 1920x1080 1.5G or 3G HD-SDI signals with frame rates from 23.976 to 60 fps according to SMPTE standards 274M, 292M, 372M and 425M (Level B).

In addition, it outputs ARRIRAW in a proprietary format that is supported by a range of third-party recorders. RGB 444 at frame rates of 48, 50, 59.94 and 60 fps is output in a proprietary format utilizing two 3G connections. The signal format can be changed in the Recording menu.

The connectors are located at the back of the camera on the camera-right side.

10.3 RET/SYNC IN

A return signal from another image source can be fed into the ALEXA’s RET connector for displaying on EVF and/or MON OUT. The signal must be a 1920x1080 422 1.5G single link according to SMPTE 274M and 292M. The output routing of the RET in signal can be set in the Monitoring menu.

The connector is located at the back of the camera on the camera-right side.

10.4 MON OUT

The MON OUT is a single BNC connector capable of carrying a 1920x1080 422 YCbCr 1.5G HD-SDI signal with frame rates of 23.976, 24, 25, 29.97 or 30 fps according to SMPTE standards 274M and 292M. The signal format can be changed in the Monitoring menu.

The connector is located at the back of the camera on the camera-right side.

10.5 EXT

The EXT connector is a multi-pin accessory connector that carries signals for communication with various accessories and 24V power. The maximum power output is 2.2A, shared with the RS outputs.

Cables are currently available for:

- Connecting a UMC-3 remote motor controller
10.6 ETHERNET

Standard ethernet connectors can deliver neither the power nor the durability and reliability required by ARRI, so the ALEXA uses a specially designed 10-pin LEMO connector. The ARRI KC-153-S cable is required to connect the Ethernet socket to a standard RJ-45 Ethernet port.

The ethernet port can be used to operate two ALEXA cameras with synced settings by connecting the cameras with a KC 156-S cable, or to connect the Remote Control Unit RCU-4 to the camera.

The ethernet connector can output 24 V with 1.2 A power.

The connector is located at the back of the camera on the camera-right side.

10.7 EVF

The EVF connector connects the camera to an EVF-1 electronic viewfinder. The signals on this connector are proprietary and can only be used to drive an EVF-1. This proprietary signal assures low latency for the viewfinder image.

The connector is located at the front of the camera on the camera-left side.

10.8 AUDIO IN

2-channel analog line-level audio can be fed to the camera via the 5-pin XLR connector located at the front of the camera on the camera-right side.

The ALEXA converts the audio signal from analog to 24 bit 48 kHz PCM.

10.9 RS

The two RS connectors supply external accessories with at least 24 V power and a combined load of up to 2.2 A (shared with the EXT connector power out). The sockets also accept an ARRI remote start/stop trigger.

The connectors are located at the front of the camera on the camera-right side.
10.10 12 V

The 12 V connector supplies an external accessory with 12 V power and up to 2.2 A current.

The connector is located at front of the camera on the camera-right side.

10.11 TC

The TC connector is a 5pin LEMO socket. It accepts and distributes a Longitudinal Time Code (LTC) signal.

It can be used to

• jam-sync the ALEXA’s time code to a Clockit, TC Slate or another camera
• transmit the ALEXA’s time code to a Clockit, TC Slate or another camera
• tune the frequency of the ALEXA's crystal oscillator with an Ambient ACC Clockit Controller

The connector is located at the front of the camera on the camera-right side.

10.12 AUDIO OUT

The AUDIO OUT is a 3.5mm TRS connector (headphone jack), which outputs audio fed to the 5-pin XLR AUDIO IN connector with a maximum power of 2.5 dBm.

The connector is located at the front of the camera on the camera-right side.

Note: Connecting a headphones to the camera while recording can cause a short audio signal interruption due to static electricity.

10.13 SD Card

The ALEXA saves data such as user setups, frame grabs and system logs to an SD card. Firmware, additional frame lines and ARRI Look Files are loaded onto the camera from the SD card. The SD card slot is located on the bottom of the camera on the camera-right side. To access the SD card slot, slide the door towards the front of the camera.

SD Card Requirements

• SD or SDHC card (most brands are compatible)
• maximum capacity of 4GB
- FAT or FAT32 format

Note: Keep the SD card slot door closed to prevent dirt and moisture from entering the camera.

The SD card can be formatted on the ALEXA or the following folder structure can be created manually on a computer. The SD card must be properly formatted prior to its first use.

![Folder structure required for SD card](image)

**Figure 27: Folder structure required for SD card**

**To format an SD card on the ALEXA:**

1. Press the **MENU** button.
2. Using the jogwheel, select System.
3. Select SD Card.
4. Select Format + prepare SD card.
5. Press both **FORMAT** buttons simultaneously. The ALEXA will create the required folder structure on the SD card after formatting.

Note: Formatting the SD card will irreversibly remove all data on the SD card.

**To create the required folder structure on the SD card in the ALEXA without formatting:**

1. Press the **MENU** button.
2. Using the jogwheel, select System.
3. Select SD Card.
4. Select Prepare SD card. The ALEXA will create the required folder structure on the SD card without formatting or deleting any data.

Note: Firmware update files are recognized by the camera anywhere within the structure, but it is recommended to copy the them into the Firmware folder.
10.14 SxS Slots

The ALEXA records clips using the SxS module on the camera-left side. The two SxS card slots can be accessed by opening the SxS door towards the camera body. The SxS door was designed for accessibility when the ALEXA is operated in confined spaces or mounted on rigs such as remote heads.

Note: Keep the SxS slot door closed to prevent dirt and moisture from entering the camera.

To load an SxS card:

1. Insert the SxS PRO card into the SxS slot with the contacts facing the front of the camera and the label facing out (away from the camera body).
2. Push the card in against the spring until the lock engages.
3. Close the SxS door.

Note: Do not force an SxS PRO card into the slot backwards or with the label-side in—the contacts in the SxS module and the SxS PRO card could be damaged.
Note: Do not force the SxS door closed if the SxS PRO card is not fully inserted and the lock engaged.

To release an SxS card:

- Push the SxS PRO card in until the lock disengages, taking care to prevent the card from dropping out of the SxS slot.

SxS PRO cards do not have to be mounted or unmounted—they can be inserted or removed whenever the camera is not recording to the SxS module. If a card is removed during recording, only the last second of the current clip will be lost. All clips on the card will remain accessible and the card will remain fully functional.

Note: If the recording process is interrupted by power loss or card removal, transfer all the data from the SxS PRO card and format it before using it again.

To toggle between SxS slots:

- With the SxS door open, press the metal card select button located between the SxS slots. The active SxS slot is indicated by the LED in the SxS window.

Explanation of SxS LED States

Each card has an LED that signals the SxS PRO card’s state to the user.
<table>

</tbody>
</table>

Note: Only Sony **SxS PRO** cards can be used with ALEXA. Sony **SxS-1** cards are not supported.
11 Lens Mounting

The ALEXA is equipped with an interchangeable lens mount. Available adapters include:

- Lens Adapter PL Mount LA-PL-1
- Lens Adapter Panavision Mount LA-PV-1

Note: Lenses must cover an image circle of at least 30 mm in diameter to prevent vignetting.

11.1 Lens Adapter PL Mount LA-PL-1 (no LDS)

The Lens Adapter LA-PL-1 is the standard lens mount delivered with the ALEXA. It can be used to attach any modern PL-mount lens to the camera.

To mount a PL-mount lens:

1. Turn the bayonet ring anti-clockwise until it stops.
2. Remove the lens port cap.
3. Carefully insert the lens into the lens port. Align the notch in the lens flange with the index pin on the mount, keeping the lens rotated into a position where the lens markings are visible from either side of the camera.
4. Press the lens flange flat onto the lens mount.
5. Turn the bayonet ring clockwise until the lens is locked securely.
6. Ensure that the lens is properly mounted.

Note: When no lens is attached to the camera, use the lens port cap to prevent dust from entering the lens cavity.

Note: The sophisticated design principle of the camera’s optical module delivers outstanding images with a cinematic look and feel, but also makes the imager sensitive to contamination. Dust particles that have settled on the sensor cover glass during a lens change may become visible as dark spots in the output image, similar to lint leaving marks on exposed film. The degree of this effect depends on the aperture of the lens.
11.2 Lens Support

Heavy lenses may require additional lens support. Using a lens support guarantees that the weight of the lens will not influence the flange focal depth and reduces stress on the lens mount.

To support a lens use 15mm studio or 19mm studio rods and an appropriate lens bridge. 15mm studio rods require a bridge-plate with 15mm studio rod support, such as a BP-3/BP-9 + BPA-1, while 19mm studio rods require a bridge-plate with 19mm studio rod support, such as a BP-12 or BP-5/BP-8 + BPA-1.

Mount the lens bridge LS-10 for 15 mm studio rods by pushing it onto the rods from the front. Mount the lens bridge LS-9 for 19 mm studio rods by clipping it on the rods from the top.

Figure 28: PL mount LA-PL-1 with index pin
Slide the bridge into position on the rods directly under the lens support ring on the lens, and fix it in place by tightening the lever on its side. Align and tighten the center screw in the lens support ring, adjusting the height of the center screw with the lever on the back of the lens bridge.

Figure 29: Camera with BP-12, 19mm studio rods and lens bridge
12 Camera Controls

The ALEXA can be controlled through three user interfaces:

Main controls
Location: camera-right side
Interface: 3-inch LCD-screen with floating-function buttons, a jogwheel to navigate through menus and adjust parameters, and a range of fixed-function buttons.

Operator controls
Location: camera-left side
Interface: three assignable function buttons plus three fixed-function buttons for easy operator access.

EVF controls
Location: Electronic Viewfinder EVF-1
Interface: fixed function buttons and a jogwheel for adjustment of viewfinder parameters and primary shooting parameters.
12.1 Main Controls

The main controls can be used to set all camera parameters.

12.1.1 Display

The 3-inch LCD has a resolution of 400x240 pixels. The back-lit, transflective display has exceptional contrast even in bright sunlight.

To adjust the LCD brightness:

- On the HOME screen, rotate the jogwheel while pressing the BACK button.

A removable plastic shield protects the display from scratches. It can be removed by pulling it off the four pins.

12.1.2 Screen Buttons

Six screen buttons are located above and below the LCD display. Their function varies depending on the screen content and is shown directly above or below each button. If no function is shown above or below a button on the LCD, it has no function for that screen.
As a failsafe, operations that cannot be reversed and can result in the loss of data require pressing two buttons simultaneously to confirm the operation.

12.1.3 HOME screen

The HOME screen is the ALEXA’s default screen. It shows the most important camera parameters and gives quick access to changing them through the screen buttons. To return to the HOME screen from any menu in the camera, press the HOME button.

Note: To adjust the LCD brightness from the HOME screen, rotate the jogwheel while pressing the BACK button.

Screen buttons

<table>
<thead>
<tr>
<th>Button</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>FPS</td>
<td>Sets the frame rate of the sensor, adjustable from 0.750-60.000 fps in Regular Speed Mode, and from 60.000-120.000 fps in High Speed Mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> High Speed Mode can only be activated with a valid High Speed license key installed in the camera.</td>
</tr>
<tr>
<td>AUDIO</td>
<td>Shows the current audio level. If AUDIO is set to Off, the audio input is switched off: no audio is embedded in the HD-SDI outputs, and no audio tracks are recorded on the SxS PRO cards. The same applies if AUDIO is disabled, which is the case if the sensor frame rate is different from the project fps setting (for example, while over- or undercranking).</td>
</tr>
<tr>
<td>SHUTTER</td>
<td>Sets the shutter angle of the sensor, adjustable from 5.0-358.0°. Shutter angle and sensor fps determine exposure time of the sensor in seconds by the following equation: ( \text{angle}/(360\times\text{fps}) ).</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> In High Speed mode, the shutter angle is limited to a maximum of 356.0°.</td>
</tr>
<tr>
<td>EI</td>
<td>Sets the exposure index rated in ASA. The ALEXA has a base sensitivity of 800 ASA. The camera’s EI rating can be adjusted from 160 to 3200 ASA.</td>
</tr>
</tbody>
</table>
Note: ASA rating is identical to ISO rating.

Note: Exposure Index is not applied to ARRI RAW signals.

**COLOR**

Opens the color screen, where gamma and look settings for SxS, REC OUT, MON OUT and EVF can be changed.

**WB**

Sets the camera’s white balance. This is the color temperature of the light source that the ALEXA is currently adjusted for. The white balance can be adjusted from 2000 to 11000 Kelvin in steps of 100 Kelvin. In addition to the red/blue correction of the white balance, the ALEXA can also compensate for a green/magenta tint. This value, called CC (color compensation), is shown as an exponent of the WB value. Positive values are marked with a “+” and negative values with a “-“.

The user can execute an automatic white balance by pressing the AUTO WB button in the WB screen.

**Camera Status Section**

**TC**

Displays the current time code including the source (INT: internal, EXT: external source). Frames are not displayed. The timebase of the time code is shown after the @ sign.

**MASTER**

Camera is set to Ext sync: MASTER

**SLAVE**

Camera is set to Ext sync: SLAVE

**BAT 1**

The voltage level of the power source present at the BAT connector, or the remaining capacity of an attached battery in percentage if it transmits this information.

**BAT 2**

The voltage level of a battery attached to the onboard battery adapter, or the remaining capacity of an attached battery in percentage if it transmits this information.

**REEL**

Identifies the current reel with the camera index letter, such as A or B and the reel number.

**CLIP**

Identifies the current clip with the clip index and clip number.

**DUR**

Displays the duration of the current clip during recording or the length of the last recorded clip while in standby in the format h:mm:ss.

**SxS1 14:20**

Capacity of the currently active SxS PRO card in minutes. It is calculated for the current framerate and codec.*

<

Marks the active SxS PRO card.

**STBY**

The camera is in standby and ready to record.

**REC**

The camera is recording.

**ERROR**

An error occurred and recording is not possible. Press the INFO button for more information.

If nothing is shown, the camera has detected no errors, but no SxS PRO card is present for recording.

* Note: When SxS recording is set to ProRes™, the value shown is the minimum available recording time for the current sensor frame rate and codec combination.
Apple ProRes™ is a variable bit rate codec, so the actual remaining recording time depends on the image content.

When using Avid's DNxHD, the remaining recording time is accurate.

Icons

</tbody>
</table>

Note: A sensor temperature warning or error after boot-up is normal as the sensor takes a few seconds to reach its preset temperature.

12.1.3.1 Lists and User Lists

On the HOME screen, press the FPS, SHUTTER, WB (white balance) and EI (exposure index) buttons to open lists of preconfigured values for each setting.

User-defined values can be added to the FPS, SHUTTER and WB lists. The EI list is fixed and user-defined values cannot be added. It contains values from 160-3200 ASA in steps of 1/3 stops.
Setting a list value

Any value in a list may be set. Invalid values will appear grayed out.

To set a list value:
1. Rotate the jogwheel to select the desired list value.
2. Press the jogwheel to set the list value.

Adding a list value

If the desired list value does not appear in the list, a user-defined value can be added.

To add a list value:
1. Press the ADD button.
2. On the ADD screen, use the jogwheel and + or – buttons to enter a new list value.
3. When you are finished entering the new list value, press the jogwheel to add it to the list.

Note: Each list supports a maximum of 16 entries. To add new user-defined list values to a full list, you must delete previously added user-defined list values.

Deleting a list value

User-defined list values that are no longer required can be deleted.

To delete a list value:
1. Press the DELETE button.
2. On the DELETE screen, use the jogwheel to select the user-defined value you wish to delete.
3. Press both DELETE buttons simultaneously.
Note: Preconfigured values cannot be deleted and will appear grayed out on the DELETE screen.

![DELETE SENSOR FPS](image)

*Figure 33: DELETE SENSOR FPS screen*

Note: The EI list is static and cannot be changed by the user. It contains ASA values from 160-3200 ASA in steps of 1/3 stop.

### 12.1.3.2 FPS

Press the **FPS** (frames per second) button on the HOME screen to open the SENSOR FPS list screen, which lists the default frame rates as well as user-defined frame rates.

![SENSOR FPS](image)

*Figure 34: SENSOR FPS screen*

Note: Access to this screen is disabled during record.

The maximum frame rate that can be set is dependent on the type of **SxS PRO** card and the codec.

The following table shows the maximum available frame rate for all codec/card combinations.
<table>
<thead>
<tr>

<tr>
<td>ProRes 4444</td>
<td>30 fps</td>
<td>48 fps</td>
</tr>
</tbody>
</table>

¹By installing a High Speed licence, the maximum available frame rate can be increased to 120 fps.

If the desired frame rate cannot be set because it is grayed out, change the SxS codec to one with a lower data rate. For example, when using a 32 GB SxS PRO card and the ProRes 4444 codec, 60,000 fps will be grayed out. Set the ProRes 422HQ codec to enable 60,000 fps.

There are shortcut buttons on the FPS screen for SxS CODEC, SxS INFO and SDI FPS. In the SDI FPS screen, both MON OUT and REC OUT frame rates can be adjusted within the limits of their current format.

**Setting sensor fps through REC OUT fps**

When the FPS button is pressed on the HOME screen and the sensor frame rate is linked to the REC OUT frame rate, a message appears instead of the list. While this setting is active, the sensor frame rate can only be set by setting the REC OUT frame rate.
To link or unlink the sensor frame rate to the REC OUT frame rate:

1. Press the MENU button.
2. On the Recording menu, use the jogwheel to select REC OUT.
3. Select REC OUT fps sets sensor fps and set On or Off.

Figure 35: SENSOR FPS screen with linked sensor frame rate

Setting the correct frame rates when recording with external devices

When recording ARRIRAW or the 444 signal from the ALEXA to an external recorder, correct frame-rate settings are critical. Mismatched sensor and REC OUT frame rates could result in dropped frames and lost footage.

Setting the sensor frame rate determines the number of frames per second generated by the sensor. The range is 0.750 to 60.000 frames per second. The images are then processed by the camera electronics for the different output paths.

The REC OUT is the recording output path, which transmits images to an external recorder. The REC OUT frame rate is limited to standard speeds.

Ideally, the REC OUT frame rate matches the sensor frame rate. If the REC OUT frame rate is lower than the sensor frame rate, the images cannot be output as fast as they are created by the sensor, resulting in dropped frames and loss of data.

Note: If the REC OUT frame rate is lower than the sensor frame rate, a ! warning will appear over the SDI FPS button.

If the REC OUT frame rate is higher than the sensor frame rate, duplicate frames are output over the REC OUT. For example, if the sensor is set to 10 fps and the REC OUT is set to 30 fps, every image is output three times, resulting in two duplicate frames following every active frame. A standard recorder would record these duplicate frames, which would have to be removed in post.

To prevent this extra step, the ALEXA marks the duplicate frames with a Variflag. If the recorder supports Variflag recording, it will discard the duplicate frames and only record the active frames. This saves valuable storage space and post-production work.
The MON OUT should match the sensor and the REC OUT frame rate. If the sensor frame rate exceeds the available MON OUT frame rates, set the MON OUT to half the sensor frame rate if possible to maximize the smoothness of the image when panning and tilting.

To correctly set frame rates for the REC OUT:
1. Press the MENU button.
2. Using the jogwheel, select the Recording menu.
3. Select REC OUT.
4. Set Frame rate to the desired frame rate. This frame rate should match the frame rate setting on the external recorder.
5. If the desired sensor frame rate is a standard speed, set REC OUT fps sets sensor fps to On.
6. Press the HOME button to exit.

To correctly set frame rates for the MON OUT:
1. Press the MENU button.
2. Using the jogwheel, select the Monitoring menu.
3. Select MON OUT.
4. Set Frame rate to the same frame rate as the REC OUT. If the REC OUT frame rate exceeds the range of the available MON OUT frame rates, set the MON OUT frame rate to half the value of the REC OUT frame rate.
5. Press the HOME button to exit.

To set a non-standard frame rate for the REC OUT:
1. Press the MENU button.
2. Using the jogwheel, select the Recording menu.
3. Select REC OUT.
4. Set REC OUT fps sets sensor fps to Off.
5. Press the HOME button to exit.
6. On the HOME screen, press the FPS button.
7. Select the desired frame rate from the list or add a user-defined frame rate (see Adding a list value in Lists and User Lists).

High Speed Mode

If a valid High Speed license key is installed on the ALEXA, frame rates from 60.000 to 120.000 fps are available in High Speed mode. Frame rates below 60.000 fps are not available. Exit High Speed mode to record frame rates lower than 60.000 fps. Default frame rates in the FPS list are 60.000, 72.000, 75.000, 90.000, 96.000, 100.000 and 120.000 fps.

High Speed mode recording is possible only to SxS PRO cards. When High Speed mode is loaded, the REC OUT outputs switch output paths and carry the MON OUT signal with a maximum frame rate of 30 fps.

Note: High Speed mode recording is possible in ProRes HD codecs only. The maximum frame rate in ProRes 2K is 60 fps in 16:9 sensor mode and 48 fps in 4:3 sensor mode.
ARRI recommends using only Sony SxS PRO 64 GB cards in High Speed mode, as only these allow recording at sensor frame rates from 60-120 fps with all High Speed codecs. When using Sony SxS PRO 32 GB cards with codecs ProRes 422, ProRes 422 HQ, DNxHD 115/120/145 and DNxHD 175x/185x/220x, the sensor frame rate is limited to 60 fps maximum.

Note: When using the ALEXA Studio, ALEXA Plus 4:3 and ALEXA M, High Speed mode is only available in 16:9 Sensor mode and ProRes HD codecs.

To load High Speed mode:
1. On the HOME screen, press the FPS button.
2. On the FPS screen, press the HIGHSPEED button.
3. Press both LOAD buttons simultaneously. Loading High Speed mode takes approximately 40 seconds and is indicated by a progress bar.
4. After loading, the current High Speed codec is displayed. Press the SET CODEC button to set a different codec.

To exit High Speed mode:
1. On the HOME screen, press the FPS HS button.
2. On the FPS HIGHSPEED screen, press the EXIT HS button.
3. Press both EXIT buttons simultaneously. Exiting High Speed mode takes approximately 40 seconds and is indicated by a progress bar.

### 12.1.3.3 AUDIO

Press the AUDIO button on the HOME screen to open the AUDIO screen. This screen shows the ALEXA’s two audio channel levels. The audio levels are displayed from -45 dBFS to 0 dBFS.

Note: No audio meters are displayed on the HOME screen or AUDIO screen when audio is set to Off or audio is disabled. Audio is disabled when the sensor frame rate does not match the project frame rate.

Light blue markers show reference levels of -20, -18 and -9 dB FS.

Red markers at levels -1 and 0 dBFS warn of clipping. With a proper audio signal levels, the red markers should almost never be visible.

Figure 36: Audio screen

Gain can be applied to the audio channels by turning the jogwheel to set both channels, or by pressing the CH 1+, CH 1-, CH 2+ and CH 2- buttons. The amount of gain applied by the camera is indicated next to the levels as light gray numbers.

Press the OPTIONS button to open the AUDIO IN>OPTIONS screen and set audio parameters.

![Figure 37: AUDIO IN>OPTIONS screen](image-url)

*Figure 39: AUDIO OUT>OPTIONS*

- **Left out**  
  Sets which channel is routed to the left output.

- **Right out**  
  Sets which channel is routed to the right output.

- **Audio out level**  
  Set the level of the audio out channels manually, or set it to fix the maximum output.

Note: These settings do not influence the audio signal embedded in the HD-SDI connectors or recorded in QuickTime clips. They only affect the AUDIO OUT connector!

Note: ALEXA automatically determines the internal signal run time and matches audio and images so they are always in sync. When changing sensor fps or project fps, it may take up to 2 seconds for the camera to resync image and audio signals.

### 12.1.3.4 SHUTTER

Press the SHUTTER button in the HOME screen to open the SHUTTER ANGLE screen.

Note: Access to this screen is disabled during record.

The list of default shutter angles includes 11.2°, 22.5°, 45.0°, 90.0°, 172.8°, 180.0°, 270.0° and 358.0°. User-defined shutter angles can be set by pressing the ADD button. The exposure time for the current frame rate and shutter angle is indicated in seconds at the bottom of the SHUTTER ANGLE screen.

The shutter angle range is 5.0° to 358.0°. In High Speed mode, the shutter angle is limited to a maximum of 356.0°.

Below the list, the actual exposure time at the currently set frame rate is shown.

Note: Be aware that the combination of long exposure times (a low sensor frame rate
and large shutter angle) and high exposure indexes can lead to image artifacts!

<table>
<thead>
<tr>
<th>SHUTTER ANGLE</th>
<th></th>
</tr>
</thead>
<tbody>

<td></td>
</tr>
</tbody>
</table>

**Exposure time @
24,000 fps: 1/50 s**

*Figure 40: Shutter list*

12.1.3.5 **EI**

The Exposure Index (EI) is the applied sensitivity of the camera.

The ALEXA has a base sensitivity of 800 ASA. This means that the dynamic range is almost evenly distributed above and below neutral gray with low noise in the shadows and clean, smooth clipping behavior in the highlights.

Due to its high dynamic range, the ALEXA's sensitivity can be set from 160 to 3200 ASA in steps of 1/3 stops while maintaining high image quality.

<table>
<thead>
<tr>
<th>EXPOSURE INDEX</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>500 ASA</td>
<td></td>
</tr>
<tr>
<td>640 ASA</td>
<td></td>
</tr>
<tr>
<td><strong>800 ASA</strong></td>
<td></td>
</tr>
<tr>
<td>1000 ASA</td>
<td></td>
</tr>
<tr>
<td>1280 ASA</td>
<td></td>
</tr>
</tbody>
</table>

*Figure 41: Exposure Index screen*

Note: The Exposure Index list has fixed content, meaning that it cannot be changed by the user.

Applying the exposure indexes at the extremes of the range will nonetheless have an influence on the images. At low exposure indexes, such as 160 ASA, the dynamic range below neutral gray increases, reducing noise even further. At the same time, the dynamic range above neutral gray is slightly reduced. Highlight clipping itself is not influenced by this, but the shoulder of the gamma curve will get slightly steeper, reducing the smoothness of the clipping.
At high exposure indexes, such as 1600 ASA, the images behave in the opposite way. Noise is increased, which makes it important to judge shadow detail, while the highlight clipping behavior will be even smoother.

<table>

![Graphical comparison of latitude at different exposure indexes](image)

*Figure 43: Graphical comparison of latitude at different exposure indexes*

### 12.1.3.6 COLOR

Press the COLOR button to open the COLOR screen. The COLOR screen displays a graphical overview of the color management settings applied to the camera’s output paths, including:
- the current gamma setting of the EVF, MON OUT, REC OUT and SxS
- which ARRI Look File is set
- which output paths the Look File is applied to

The COLOR screen also has buttons for opening the GAMMA screen, selecting a Look File, and applying Look Files to the camera’s output paths.

Figure 44: COLOR screen

Gamma

Press the GAMMA button to open the GAMMA screen and set the gamma of the SxS, REC OUT, MON OUT and EVF image paths.

Figure 45: GAMMA screen

Gamma defines the contrast curve that is applied to the image. In the ALEXA, there are two gamma settings available:

- LOG C
- REC 709

Note: Starting with SUP 7.0, DCI P3 is no longer available as a gamma option.
LOG C
LOG C is a Cineon-specification gamma for output to film print or digital intermediate. Color-grading is a required post-production step in the LOG C workflow. Standard broadcast monitors cannot properly display LOG C images so a conversion look up table (LUT) is necessary for display, dailies and editing proxies. LOG C images will appear flat and desaturated when displayed on standard broadcast monitors. ALEXA preview LUTs can easily be generated using the ARRI LUT Generator, a web application available on www.arridigital.com.

REC 709
REC 709 is a video display gamma that complies with the ITU.R-BT709 standard. REC 709 images can be displayed on standard broadcast monitors.

Note: In High Speed mode, a gamma setting cannot be applied to the REC OUT as the MON OUT output path is rerouted to the REC OUT.

ARRI Look Files
ARRI Look Files are a way for the user to alter the parameters the ALEXA uses when converting the sensor image data to a video color space. This can be described as applying a custom "look" to the different image output paths. The Look File can be applied directly to the recorded image (destructive workflow), or just to the monitoring paths and included in the clip as metadata only (non-destructive workflow).

The ALEXA contains one preloaded Look File called Low Contrast Curve (LCC). This Look File contains a custom tone map curve that creates a video image with lower contrast compared to the standard REC 709 output. As a result, the image holds as much dynamic range information as possible, without using LOG C encoding. Highlight and shadow detail that would be lost in the typical REC 709 tone mapping can still be accessed.

ARRI LOOK Creator, a free application from ARRI, and some third-party applications can be used to create ARRI Look Files from DPX-format frame grabs taken on the ALEXA.

To apply a Look File:
1. On the HOME screen, press the COLOR button.
2. Press the SET LOOK button.
3. Using the jogwheel, select a Look File from the list on the LOOK FILES screen. The default preloaded Look File is LCC.
4. Press the jogwheel to set the Look File.

On the COLOR screen, press the EVF, MON OUT, SxS and/or REC OUT buttons to apply the Look File to the desired output paths. An applied Look File is indicated by a check mark in the box corresponding to each output path. Look Files can only be applied to output paths that are set to REC 709 gamma.

Note: If the SxS or REC OUT paths are set to REC 709 gamma and a Look File is
applied, the recorded image on the SxS Pro card or external recording device will be permanently altered by that Look File.

Note: If both the SxS and REC OUT paths are set to REC 709 gamma, a Look File can only be applied to either both or none of them.

Note: In High Speed mode, a Look File cannot be applied to the REC OUT as the MON OUT output path is rerouted to the REC OUT.

Additional Look Files can be added to the ALEXA from the SD card. The Look Files must be copied into the LookFiles folder on the SD card. The required folder structure on the SD card can be created via MENU>System>SD card>Prepare SD card.

To add a Look File to the camera:

1. On the HOME screen, press the COLOR button.
2. Press the SET LOOK button.
3. Press the ADD button.
4. Using the jogwheel, select a Look File from the list on the LOOK FILES (SD CARD) screen.
5. Press the jogwheel to add the Look File. The Look File will be added to the list on the LOOK FILES screen.

To delete a Look File from the camera:

1. On the LOOK FILES screen, select a Look File from the list.
2. Press the DELETE button.
3. Press both new DELETE buttons simultaneously. The Look File will be deleted from the camera but will remain on the SD card.

Playback and Look Files

The Look File applied to the camera outputs also applies to clips during playback. A clip recorded in REC 709 with or without Look File will be played back "as is", even if the output is set to LOG C.

Please note that the currently active Look File is applied to the clip, not the one that was active at the time of recording. It is the responsibility of the user to make sure the correct Look File is applied during playback.

12.1.3.7 WB

White Balance (WB) is the color balance of the camera according to the lighting in use. There are three options for setting the white balance:

- white balance presets
- user-defined white balance
- automatic white balance

On the HOME screen, press the WB button to open the WHITE BALANCE screen. The ALEXA has the following white balance presets:
Camera Controls

Tungsten 3200K 0CC
Fluorescent 4300K 0CC
Daylight 5600K 0CC
Daylight Cool 7000K 0CC

White balance is a red-blue adjustment of the image. To adjust the green-magenta balance, use the color compensating (CC) adjustment.

For example, a fluorescent source will have peaks in its spectrum that cannot be corrected with the traditional white balance. The CC shift can correct these peaks up to a full green or full magenta gel. One step of CC SHIFT is equal to 0.35 Kodak CC values or 1/8 Rosco values.

![Figure 46: WHITE BALANCE screen](image)

ARRI recommends adjusting white balance and color compensation using appropriate measuring equipment such as a vectorscope with calibrated gray card or a color meter.

If the desired white balance setting does not appear in the WHITE BALANCE list, a user-defined white balance can be added.

To add a white balance:

1. On the HOME screen, press the WB button.
2. Press the ADD button.
3. Rotate the jogwheel to adjust the white balance value in steps of 100K or press the +1000K and −1000K buttons.
4. Press the jogwheel or <> button to select the CC adjustment.
5. Rotate the jogwheel to adjust the CC value.
6. Press the jogwheel to add the new white balance to the WHITE BALANCE list.

To perform an automatic white balance:

1. On the HOME screen, press the WB button.
2. Press the AUTO WB button.
3. Place a well-lit gray card in the center of the image and press the AUTO WB button. The ALEXA will calculate the white balance and color compensation values and set these values for the "Auto WB" entry in the list.

Note: The automatic white balance will be overwritten each time a new one is calculated.
Note: If the gray card is significantly over- or underexposed, the ALEXA may not be able to calculate a white balance value and will display an error message.

To rename a white balance:
1. On the HOME screen, press the WB button.
2. Using the jogwheel, select the name of the white balance you wish to rename.
3. Press the RENAME button.
4. Use the jogwheel to enter a new name.
5. Press the DONE button to save the new name.

![Figure 47: WB SET NAME screen](image)

Note: Default white balance values cannot be renamed.

### 12.1.4 Function Buttons

The main controls feature the following function buttons:

- **ON/OFF**
  - Press once to switch the camera on. Press and hold for 5 seconds to switch off the camera. A countdown will be displayed on the HOME screen. If the button is released before the countdown has elapsed, the camera does not switch off.

- **REC**
  - Press to start and stop internal recording to SxS PRO cards and send start and stop record signals over the REC OUT to an external recording device.
LOCK  Press and hold for 3 seconds to lock or unlock the main camera controls and function buttons. The recessed function buttons USER, REC and ON/OFF cannot be locked and remain available. A lock symbol on the HOME screen indicates that the lock is engaged.

GRAB  Press to take a still frame and write it to the SD card. The write process is indicated by a flashing camera icon, followed by a flashing SD card icon on the HOME screen. When writing is finished, a new still frame can be taken.

TC  Press to open the TIMECODE screen.

PLAY  Press to open the playback screen and activate playback on MON OUT and EVF. When the playback screen is opened, the last clip on the SxS PRO card that is on active standby will be loaded automatically.

INFO  Press to open the LIVE INFO screen. The LIVE INFO screen displays the camera’s current system state and any current error messages. On the LIVE INFO screen, there are buttons to access the following additional information screens:

- VERSION
- SxS CARDS
- SYSTEM
- SAVE TO SD (press to save a log file)
- FPS INFO

USER  Press to open the USER BUTTONS screen. There are six user buttons that can be assigned by the user. Buttons 1, 2 and 3 are shared with User Buttons 1, 2, and 3 in the operator controls. Press the jogwheel to see a complete list of user button options.

MENU  Press to open the MENU screen, where most camera settings can be adjusted.

BACK  Press to go back to the previous menu or screen when navigating. Press to cancel settings adjustments and revert to the previous setting.

HOME  Press to return to the HOME screen from any menu or screen.
12.1.4.1 TC

Press the TC button to open the TIMECODE screen. The TIMECODE screen displays the current timecode and timecode format settings.

![TIMECODE Screen](image)

**Figure 48: Timecode screen**

Note: Individual frame values are not shown but are still counted.

Press the SET TC button to set the TC counter (only when the timecode source is set to Int TC). On the SET TIMECODE screen, press the SET 2 TIME button to match the counter to the camera’s system clock. Press the RESET button to reset counter to zero.

The PROJECT button is a quick link into the PROJECT menu screen, where project fps can be adjusted. Project fps sets the time base of the time code.

**TIMECODE OPTIONS**

Press the OPTIONS button to open the TIME CODE OPTIONS screen.

Select Source to choose the timecode source. Available sources are:

- **Int TC**: Internal TC counter
- **Ext LTC**: TC is read from the LTC input. Only possible with Mode set to Free Run, and the project frame rate must match the sensor frame rate.

Select Mode to define how the timecode is counted. Available modes are:

- **Rec Run**: TC will only run while recording. The TC value increases with every frame generated by the sensor while recording in the project time base.
- **Free Run**: TC runs free. If the source is set to Int TC, and the sensor frame rate does not match the time base of the TC, the value counts up with every new frame generated by the sensor in the project time base.
Select Generator to set the camera’s timecode generator. Available generators are:

**Regen**
Rec Run TC is regenerated from the last valid TC value. When set to Ext LTC, the camera continuously reads the TC signal at the LTC connector as long as it is present. Upon disconnection or loss of signal, the camera continues counting on its own. When the external signal is reconnected, the camera uses the values of the external signal again. When set to Int TC, the value increases with each new frame generated by the sensor.

**Jam sync**
Only Ext LTC can be jam sync’d. This means that the external TC source is connected to the camera, then the camera reads the external TC count and continues counting on its own. The precise crystal oscillator in the ALEXA will count accurately for up to eight hours. After eight hours, re-jam sync the camera to prevent timecode offset. The camera can be sync’d to TC signals whose time base differs from the camera’s project time base, as long as both are integer (24, 25 and 30 fps) or non-integer (23.976 and 29.97 fps) signals. It is not possible to mix integer and non-integer signals.

Note: It is recommended to jam-sync after every shooting break to avoid the risk of losing timecode sync during a shot.

Note: The camera will keep its TC for about 10 minutes after disconnection from the power source. If a power source is connected, the camera will remember its TC for as long as the power source is connected, even if it is switched off.

Select User bit source to set the source of the user bits. Available user bit sources are:

**Internal**
User bits are set manually in the User Bit screen.

**UB in Ext TC**
When the timecode source is set to Ext LTC, the user bits are sampled from the external signal.

Note: The camera will force timecode to *Int TC* and *Regen* if the sensor frame rate does not match the project frame rate.

Note: Non-integer TC time base settings 23.976 and 29.97 are always counted as non-dropframe time code.

**USER BITS**
Press the USER BITS screen button to access the USER BITS screen. For each user bit, values from 0 to 9 and A to F can be set.
Press the SET UB button to start editing the user bits values.

![SET UB button](image)

**USER BITS**

00:00:00:00

User bits source: Internal

*Figure 49: USER BITS screen*

Note: On HD-SDI out, the last two digits of the user bits contain the Variflag. Full user bits are only stored on the SxS cards.

### 12.1.4.2 INFO

**STATUS Info**

The STATUS INFO screen displays information about the current state of the camera system. *System state: Good* means that all components in the ALEXA are functioning normally. Other messages can contain error messages prefixed with *E:*, or warnings prefixed with *W:*. For more information about error messages and warnings, see *A.4 Error Messages and Warnings* in the Appendix.

Press the SAVE TO SD button to save a system log to the SD card. This may take up to one minute.

Note: It is only necessary to save a system log if the camera experiences multiple error messages or other abnormal behavior. The system log is not a human-readable file and should be sent to an ARRI Camera Service center for analysis.
Camera Controls

VERSION Info

Cam serial no.  The serial number of the camera.
Cam ID  Translation of the camera serial number to Base36, with an additional prefix for 3D applications.
Firmware  Version number of the currently installed camera Software Update Packet (SUP).
EVF serial no.  The serial number of the Electronic Viewfinder EVF-1 attached to the camera.
EVF firmware  Version number of the Electronic Viewfinder EVF-1 firmware.

SxS CARDS Info

Codec  Current codec for internal recording.
Status  Current status of SxS PRO cards in slot 1 and 2.
Free capacity  Free storage space of SxS PRO cards displayed as a percentage.
Max. fps current  Maximum frame rate of the SxS PRO cards with current codec.
Card size  Total available storage space on SxS PRO card
Main Controls

**SYSTEM Info**

- **Time/Date**: Current date and time. To set the date and time, press the MENU button, select SYSTEM and select DATE/TIME.
- **Fan speed**: Speed of the camera's cooling fan in rotations per minute.
- **Sensor mode**: Shows the active sensor mode: 16:9 or 4:3. 4:3 mode is only available on the ALEXA Plus 4:3, ALEXA Studio and ALEXA M.
- **Sensor temperature**: Current temperature of image sensor. Target is 35°C in standard mode, 40°C in high humidity mode.
- **IP address**: IP address of the camera's ethernet port.
- **Operating time**: Shows the total operating time of the camera in hours (since first installation of SUP 4.0 or higher).

**FPS Info**

The FPS Info screen displays an overview of the current frame rates set in the camera and the maximum frame rate possible on the SxS PRO cards loaded in the camera at the current settings.

- **Sensor fps**: Frames per second generated by the sensor.
Project fps Time base the camera will use for counting timecode and the frame rate used for on-camera playback of internally recorded clips

REC OUT frame rate Frame rate output over the REC OUT HD-SDI

MON OUT frame rate Frame rate output over the MON OUT HD-SDI

SxS CARD 1 max. fps Maximum frame rate the SxS PRO card in card slot 1 can record at the current SxS codec.

SxS CARD 2 max. fps Maximum frame rate the SxS PRO card in card slot 2 can record at the current SxS codec.

12.1.4.4 PLAY

Clips that have been recorded to the SxS PRO cards can be played back by the camera on the EVF, MON OUT and REC OUT.

Note: The REC OUT signal cannot be used for playback when it is set to ARRIRAW.

To play clips that have been recorded internally:
1. Press the PLAY button.
2. On the PLAY screen, the last clip recorded loads. Press the jogwheel to play the clip.
3. Press the jogwheel to pause the clip.
4. Rotate the jogwheel to advance the clip frame by frame, or in one second steps. Press the STEPSIZE button to toggle between seconds and frames.
5. Press the +10% and –10% buttons to advance or rewind the clip by ten percent of its duration.
6. Press the HOME button or BACK button to exit and output a live image over the output paths.

Figure 56: PLAY screen
PLAY screen buttons

**STEPSIZE**
Toggle the scrub step size between one frame and one second.

**CIRCLE CLIP**
Press to mark the clip as a circle take. This information will be embedded in the metadata of the clip.

**+10%**
Advance the current clip by ten percent of the clip duration.

**-10%**
Rewind the current clip by ten percent of the clip duration.

Note: Recorded clips do not contain the surround view portion of the EVF-1 or MON OUT image. When playing back clips, the surround view portion will not be visible.

The jogwheel can be used to scrub through the paused clip. The scrub stepsize is shown in the lower middle section of the screen.

Additional PLAY screen information:
- clip name
- playback progress bar with current playback position in time and total clip duration
- playback timecode

Note: Do not eject an SxS PRO card during playback.

OPTIONS

The OPTIONS screen button opens a list of general playback options.

<table>
<thead>
<tr>
<th>PLAY OPTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Clip end action</strong></td>
</tr>
<tr>
<td><strong>Show frame lines</strong></td>
</tr>
<tr>
<td><strong>Status info on MON OUT</strong></td>
</tr>
</tbody>
</table>

*Figure 57: PLAY OPTIONS screen*

Clip end action
Determines what happens when the end of a clip is reached. Options are Pause and Loop.
Show frame lines | Sets frame lines to On or Off during playback. Center mark is always switched off during playback.
Status info on MON OUT | Sets status info overlays on MON OUT during playback to On or Off.

CLIPLIST

Press the CLIPLIST button to open the SxS CLIPLIST screen and access all the clips recorded on an SxS PRO card.

To play a clip from the cliplist:
1. Press the CLIPLIST button.
2. Use the jogwheel to select a clip.
3. Press the jogwheel to load the selected clip.
4. Press the jogwheel to play the selected clip.

Additional CLIPLIST screen information:
- number of selected and total number of clips on the SxS PRO card
- codec of selected clip
- duration of selected clip

![SxS CLIPLIST Screen](image)

**Figure 58: SxS CLIPLIST screen**

Playback and Look Files

The Look File applied to the camera outputs also applies to clips during playback. A clip recorded in REC 709 with or without Look File will be played back "as is", even if the output is set to LOG C.

Please note that the currently active Look File is applied to the clip, not the one that was active at the time of recording. It is the responsibility of the user to make sure the correct Look File is applied during playback.
12.1.5 Menu

The menu contains parameters for basic camera setup. It has a tree structure and the current path in the menu is displayed across the top of every screen.

Press the MENU button to open the MENU screen. There are six submenus in the main menu for setting up the ALEXA:

- Recording
- Monitoring
- Project
- System
- Frame grabs
- User setups

Links to submenus can be identified by an arrow bracket character on the right side. To access a submenu, select the submenu link and press the jogwheel to open the submenu. Press the BACK button to step back one menu.

Menus also contain parameters with editable values. The parameter name is displayed on the left side of the menu, and the current value is displayed on the right side of the menu. To change a parameter value, select it with the jogwheel and press the jogwheel to start editing the value. Press the BACK button to cancel an edit. When a parameter is displayed in gray, it cannot be edited with current camera settings.

Press the HOME button from any menu or submenu to return to the HOME screen.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Figure 59: MENU

12.1.5.1 Recording

Select the Recording menu to adjust all recording parameters for recording to SxS PRO cards and to external recorders over the REC OUT outputs. The Recording menu contains two submenus:

- SxS CARDS
SxS CARDS
Select the SxS CARDS submenu to adjust parameters for recording internally to the SxS PRO cards.

**MENU>RECORDING>SxS CARDS**

<table>
<thead>
<tr>
<th>SxS recording</th>
<th>ProRes 4444</th>
</tr>
</thead>
<tbody>
<tr>
<td>SxS resolution</td>
<td>HD (1920x1080)</td>
</tr>
<tr>
<td>Dual recording</td>
<td>Off</td>
</tr>
<tr>
<td>Quick format SxS CARD 1</td>
<td>&gt;</td>
</tr>
<tr>
<td>Quick format SxS CARD 2</td>
<td>&gt;</td>
</tr>
</tbody>
</table>

**SxS recording**
Select for SxS recording options:
- Off,
- ProRes™
- DNxHD (requires license key)

With SxS recording off, power consumption is reduced by 15 W. Switching SxS recording on takes approximately 15 seconds.

**Codec**
Select to set the codec:
- full range of Apple ProRes™ codecs
- two types of Avid DNxHD codecs (requires license key).

*Note: Not available in High Speed mode.*

**HS codec**
Select to set the codec for High Speed mode:
- full range of Apple ProRes™ codecs
- two types of Avid DNxHD codecs (requires license key).

*Note: Only available in High Speed mode.*

**SxS resolution**
Select to set the SxS resolution:
- HD (1920x1080)
- 2K (2048x1152) in 16:9 mode.
Camera Controls

Note: In 4:3 mode, resolution is fixed at 2K (2048x1536).

Note: DNxHD codecs are only available in HD (1920x1080) resolution.

Dual recording
Select to set simultaneous recording to two SxS PRO cards. Both cards must be of the same capacity and have matching formatting and content.

Quick format SxS CARD 1 and 2
Select to format an SxS PRO card. To complete the action, press both FORMAT buttons on the confirmation prompt. A quick format erases only the file allocation table.

Erase SxS CARD 1 and 2
Select to erase an SxS PRO card. To complete the action, press both ERASE buttons on the confirmation prompt. This action takes longer than the quick format, but ensures that all data on the card is erased. Erasing an SxS PRO card can increase its write speed.

Note: Before formatting or erasing an SxS PRO card, make sure the write-protect tab on the back edge of the SxS PRO card is disengaged. Do not engage or disengage the write-protect tab while the card is loaded in the SxS slot.

Note: Formatting or erasing an SxS PRO card removes all data irreversibly from the card. Follow data management best practices to prevent loss of data.

If an SxS PRO card without a valid file system is loaded in the camera, you will be prompted to format the SxS PRO card immediately. ARRI recommends immediate formatting of SxS PRO cards that trigger this warning.

Apple ProRes™ codecs

Apple ProRes™ codecs supported by the ALEXA:

<table>
<thead>
<tr>
<th>Name</th>
<th>Color coding</th>
<th>Data rate @ 30 fps</th>
<th>Recording time on 32 GB SxS PRO @ 30 fps</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProRes 422 (Proxy)</td>
<td>YCbCr</td>
<td>45 Mb/s</td>
<td>1 h 23 min</td>
</tr>
<tr>
<td>ProRes 422 (LT)</td>
<td>YCbCr</td>
<td>102 Mb/s</td>
<td>37 min</td>
</tr>
<tr>
<td>ProRes 422</td>
<td>YCbCr</td>
<td>147 Mb/s</td>
<td>25 min</td>
</tr>
<tr>
<td>ProRes 422 (HQ)</td>
<td>YCbCr</td>
<td>220 Mb/s</td>
<td>17 min</td>
</tr>
<tr>
<td>ProRes 4444'</td>
<td>RGB'</td>
<td>330 Mb/s</td>
<td>11 min</td>
</tr>
</tbody>
</table>
Main Controls

1Without alpha channel (444 only)

Apple ProRes™ is a variable bit rate codec, meaning that the available recording time is subject to the image content. The number given in the table is the MINIMUM available recording time for a 32 GB card. When image content is easily compressed without loss of image quality, the available recording time may exceed the number given in the table.

Also note that the available recording time is listed for a 32 GB SxS PRO card at 30 fps. A lower sensor frame rate will increase the available recording time, while a higher sensor frame rate will decrease it.

For a detailed table of available frame rates and possible codec/card combinations, please refer to the Chapter FPS on page 59.

Avid DNxHD codecs

Avid DNxHD codecs supported by the ALEXA (when the required license key is installed):

<table>
<thead>
<tr>
<th>Name</th>
<th>Color coding</th>
<th>Data rate @ 29.97 fps</th>
<th>Recording time on 32 GB SxS PRO @ 29.97 fps</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNxHD 115/120/145</td>
<td>YCbCr</td>
<td>145 Mb/s</td>
<td>29 min</td>
</tr>
<tr>
<td>DNxHD 175x/185x/220x</td>
<td>YCbCr</td>
<td>220 Mb/s</td>
<td>19 min</td>
</tr>
</tbody>
</table>

DNxHD 115/120/145 has a bit depth of 8 bit. DNxHD 175x/185x/220x has a bit depth of 10 bit. The listed recording times are not dependent on image content.

DNxHD is a fixed bitrate codec. The codec naming convention indicates the codec’s project frame rate:

- DNxHD 115 = 23.976/24 fps
- DNxHD 120 = 25 fps
- DNxHD 145 = 29.97 fps (30 fps is not available)
- DNxHD 175x = 23.976/24 fps
- DNxHD 185x = 25 fps
- DNxHD 220x = 29.97 fps (30 fps is not available)

For a detailed table of available frame rates and possible codec/card combinations, please refer to the Chapter FPS on page 59.
Select the REC OUT submenu to adjust parameters for recording to external recorders over the HD-SDI REC OUT outputs.

Note: Only use double shielded HD-SDI cables for recording to ensure error free data transmission!

Frame rate
Select to set the frame rate of the REC OUT outputs (independent of sensor frame rate).

HD-SDI format
Select to set the format of the REC OUT outputs (see below for details):
- 422 (1.5G DL, 3G SL, 3GDL)
- 444 (1.5G DL, 3G SL, 3GDL)
- ARRIRAW (1.5G DL, 3G SL, 3GDL)
- MON OUT clone

Scan format
Select to set the type of scan:
- p: Progressive. Images are transmitted line by line from left to right, starting at the top-left pixel.
- psf : Progressive segmented. Images are first split into fields, which are then transmitted line by line from left to right.

Note: Frame rates over 30 fps are only available in progressive scan. This complies with SMPTE standards.
**Output range**
Select to set which bit range of the full 10 bit range (0-1023) is used to transmit image data.

- **Legal**: Uses values 64-940 for RGB and Y signals, and values 64-960 for CbCr signals. This complies with SMPTE 274M 8.7.
- **Extended**: uses values 5-1019, which results in about 10% more steps. This complies with SMPTE 274M 8.12 (called undershoot/overshoot).

*Note: Check which mode your recorder supports. If you set the camera to extended, but your recorder only supports legal, you will end up with clipped images!*

**REC OUT fps sets sensor fps**
If set to "On", the sensor will always follow the REC OUT frame rate setting. This ensures no frames are dropped on the output.

---

Note: Both REC OUT and MON OUT carry a flag in their data stream to signal an external recorder that the camera has started or stopped recording internally. When **SxS** recording is switched off, the REC button will only send the flag to trigger the external recorder—it will not start or stop internal recording to SxS. Additionally, the Vari flag marks duplicate images in the HD-SDI stream. A recorder that supports the Vari flag can detect these frames and discard them. This ensures that no duplicate frames are recorded if HD-SDI is set to a higher frame rate than the sensor.

---

</tbody>
</table>

¹Proprietary signal format, as no SMPTE standard supports RGB 444 with frame rates higher than 30 fps. Only supported by some recorders.

²The RAW sensor image is transmitted wrapped as 1920x1080 RGBA. This signal can only be recorded with ARRIRAW T-Link certified recorders. Some recorders only support certain types of ARRIRAW T-Link.

³When in High Speed mode, REC OUT is always set to MON OUT clone.

30-60 fps recording with ALEXA over HD-SDI

Unlike the ARRIFLEX D-21, which used a proprietary mode for recording frame rates between 30-60 fps, the ALEXA complies with the SMPTE 372M standard for image transmission in 422 1.5G DL and 3G SL formats.

This means that images are split into fields, and every field is transmitted over one link. The second field of every image is transmitted over the other link, so that every link carries an interlaced signal in field integration mode. The recorder realigns the images correctly into a progressive sequence.

Two proprietary formats allow transmission of 444 RGB or ARRIRAW images at frame rates between 30-60 fps. These are 444 3G DL for RGB and ARRIRAW 3G DL for raw images. These formats do not comply to a SMPTE standard and are only supported by a few recorders. Please refer to the manual of your recorder to see if it supports these formats.

12.1.5.2 Monitoring

Select the Monitoring submenu to adjust parameters for monitoring on the EVF-1 and over the MON OUT output. These outputs are meant for monitoring and not recording.
Frame lines set in the Frame lines submenu apply to both MON OUT and EVF-1. Select the Electronic viewfinder and MON OUT submenus to switch the set frame lines on or off individually.

<table>
<thead>
<tr>
<th>MENU&gt;MONITORING</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Electronic viewfinder</strong> &gt;</td>
</tr>
<tr>
<td><strong>MON OUT</strong> &gt;</td>
</tr>
<tr>
<td><strong>Frame lines</strong> &gt;</td>
</tr>
<tr>
<td><strong>RET IN path</strong> EVF</td>
</tr>
<tr>
<td><strong>Electronic horizon sensitivity</strong> 1x</td>
</tr>
<tr>
<td><strong>False color index</strong> &gt;</td>
</tr>
</tbody>
</table>

- **Electronic viewfinder**: Select to adjust EVF-1 settings.
- **MON OUT**: Select to adjust MON OUT settings.
- **Frame lines**: Select to set up frame lines.
- **RET IN path**: Select to set which of the monitoring output paths carries the signal at the RET IN connector as Return in active is toggled via a USER button.
- **Electronic horizon sensitivity**: Select to adjust the sensitivity of the electronic horizon. *Note: Available on ALEXA Plus, ALEXA Plus 4:3, ALEXA Studio and ALEXA M only*
- **False color index**: Select to open the FALSE COLOR INDEX screen which has a reference chart explaining the false color coding for EVF and MON OUT.

### Electronic Viewfinder

<table>
<thead>
<tr>
<th>MENU&gt;MONITORING&gt;EVF</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Brightness</strong> 4</td>
</tr>
<tr>
<td><strong>Rotate image</strong> Off</td>
</tr>
<tr>
<td><strong>Smooth mode</strong> Off</td>
</tr>
<tr>
<td><strong>Surround view</strong> On</td>
</tr>
<tr>
<td><strong>Frame lines + status info</strong> &gt;</td>
</tr>
<tr>
<td><strong>Peaking</strong> Off&gt;</td>
</tr>
</tbody>
</table>

- **Brightness**: Select to adjust the brightness of the EVF.
Rotate image

When mounting the EVF to the right side of the camera, the image can be flipped to orient the image correctly in the viewfinder. Affects only the EVF image, MON OUT and recording images are not rotated.

Smooth mode

Select to set Smooth mode On or Off. With smooth mode on, the EVF image shutters less when panning.

Note: Smooth mode is only possible with frame rates up to 30 fps and shutter angles of 180.0 or less.

Surround view

Select to set Surround view on the EVF-1 On or Off. When set to on, the additional pixels outside the recorded image area on the ALEXA’s ALEV III sensor are displayed, allowing the operator to see outside the recorded image and keep unwanted objects, such as microphone booms, out of the shot. To view only the recorded image, set Surround view to off.

Frame lines + status info

Select to set frame lines, surround mask, center mark and status info overlays to On or Off in the EVF.

Peaking

Select to set peaking in the EVF to On or Off, and the strength of peaking to low, medium or high.

Anamorphic desqueeze

Select to set Anamorphic desqueeze to 1.3x, 2.0x and 2.0xmag. The desqueeze corrects the image for 1.3x and 2.0x anamorphic lenses. With 2.0x lenses, the user can choose between viewing the full sensor image (2.0x), or only the relevant image area (2.0xmag) where left and right sides of the EVF-1 image outside the 2.39 aspect area are cropped.

Only available if a license for anamorphic desqueeze is active in the camera.

Zoom position

Select to set the Zoom position to Centered or Eye level. Press the ZOOM button on the EVF-1 to magnify:

- Centered – the center of the image is magnified for focus check
- Eye level – the image is magnified for focus check along a line approximately one third from the top, where an actor’s eyes are commonly located in image composition.

Frame lines + status info screen

Frame lines

Select to set frame lines to On or Off. Frame lines are a reference for framing that typically consist of an image frame, a center mark and an aspect ratio reference. See the appendix for more information on the ALEXA frame line format.

Surround mask

Select to adjust the Surround mask settings. If surround view is set to “On”, it must be separated from the recorded image area to allow proper framing. Users can choose:
• Black line
• Color line
• Mask 25%
• Mask 50%
• Mask 100%

Center mark
Select to set the Center mark to Off, Dot or Cross to aid in image framing.

Status info
Select to set Status info to On or Off. When set to On, camera shooting parameters are displayed across the top of the EVF-1’s image, outside the active image area and camera status information is displayed across the bottom of the EVF-1’s image, outside the active image area.

Electronic horizon
Select to set the electronic horizon level to On or Off.
*Only available on ALEXA Plus, ALEXA Plus 4:3, ALEXA Studio and ALEXA M.*

LDS info
Overlay showing LDS lens info.
*Only available on ALEXA Plus, ALEXA Plus 4:3, ALEXA Studio and ALEXA M.*

**MON OUT**

The MON OUT is a 422 1.5G single link HD-SDI output. The output range is fixed at legal range.

Frame rate
Select to set the MON OUT frame rate to 23.976, 24, 25, 29.97 or 30 fps. The frame rate should, if possible, match the sensor frame rate to avoid dropped frames or duplicate frames on the output, which would result in jittery images during camera movement or when image subjects are moving.

Scan format
Select to set the type of scan:
• p: Progessive. Images are transmitted line by line from left to right, starting at the top-left pixel.
• psf: Progressive segmented. Images are first split into fields, which are then transmitted line by line from left to right.

Surround view
Select to set Surround view on the MON OUT On or Off. When set to on, the additional pixels outside the recorded image area on the ALEXA’s ALEV III sensor are displayed, allowing the operator to see outside the recorded image and keep unwanted objects, such as microphone booms, out of the shot. To view only the recorded image, set Surround view to off.

Frame lines + status info
Select to set frame lines, surround mask, center mark and status info overlays to On or Off on the MON OUT.
Peaking
Select to set peaking on the MON OUT to On or Off, and the strength of peaking to low, medium or high.

False color
Select to activate the false color display on the MON OUT. The false color display is an exposure tool that overlays the image with color coding to highlight areas with significant luminance values.

Anamorphic desqueeze
Select to set Anamorphic desqueeze to 1.3x, 2.0x and 2.0x mag (only available if a license for anamorphic desqueeze is active in the camera). The desqueeze corrects the image for 1.3x and 2.0x anamorphic lenses. With 2.0x lenses, the user can choose between viewing the full sensor image (2.0x), or only the relevant image area (2.0x mag) where left and right sides of the MON OUT image outside the 2.39 aspect area are cropped.

Only available if a license for anamorphic desqueeze is active in the camera.

Note: Only use double shielded HD-SDI cables for monitoring to ensure error free data transmission!

Frame lines + status info screen

Frame lines
Select to set frame lines to On or Off. Frame lines are a reference for framing that typically consist of an image frame, a center mark and an aspect ratio reference. See the appendix for more information on the ALEXA frame line format.

Surround mask
Select to adjust the Surround mask settings. If surround view is set to “On”, it must be separated from the recorded image area to allow proper framing. Users can choose:

- Black line
- Color line
- Mask 25%
- Mask 50%
- Mask 100%

Center mark
Select to set the Center mark to Off, Dot or Cross to aid in image framing.
Main Controls

Status info
Select to set Status info to On or Off. When set to On, camera shooting parameters are displayed across the top of the MON OUT image, outside the active image area and camera status information is displayed across the bottom of the MON OUT image, outside the active image area.

Electronic horizon
Select to set the electronic horizon level to On or Off. Only available on ALEXA Plus, ALEXA Plus 4:3, ALEXA Studio and ALEXA M.

LDS info
Select to set the LDS lens information overlay to On or Off. Only available on ALEXA Plus, ALEXA Plus 4:3, ALEXA Studio and ALEXA M.

Show reel + clip info
Select to display reel and clip numbers on the MON OUT image.

Camera index letter
Select to display the camera index letter in the top left corner of the MON OUT image.

Frame Lines

<table>
<thead>
<tr>
<th>Frame line 1</th>
<th>ARRI 1.85</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frame line 2</td>
<td></td>
</tr>
<tr>
<td>User rectangles</td>
<td>Off</td>
</tr>
<tr>
<td>Color</td>
<td>Red</td>
</tr>
<tr>
<td>Intensity</td>
<td>2</td>
</tr>
</tbody>
</table>

Frame lines are an image overlay that can be applied to either the EVF image, the MON OUT image, or both.

ALEXA frame lines are stored as XML files that define the frame lines’ aspect ratio, marker style, line width, center marker and more. The color of the frame lines is set on the camera.

The following default frame lines are loaded onto the ALEXA:

- 1.33:1
- 1.66:1
- 1.78:1
- 1.85:1
- 2.39:1
- 2.39:1 2.0x anamorphic
Additional frame lines can be loaded from the SD card. To create additional frame lines, use ALEXA Frameline Composer, a free web tool at http://www.arri.com/camera/digital_cameras. Save the new frame lines as XML files to an SD card formatted on the ALEXA, in the Frame lines folder. The ALEXA supports up to 16 frame line templates.

To load additional frame lines:
1. In the FRAME LINES menu, select Frame line 1 (or Frame line 2).
2. Press the ADD button.
3. On the FRAME LINES (SD CARD) screen, use the jogwheel to select the frame line you wish to add.
4. Press the jogwheel to add it to the FRAME LINES list.
5. Using the jogwheel, select the new frame line in the FRAME LINES list.
6. Press the jogwheel to set the new frame line.

Frame line 1
Select to set the primary frame line template.

Frame line 2
Select to set a secondary frame line, if desired.

User rectangles
Select to open the User rectangles menu, where two custom user rectangle overlays can be adjusted.

Color
Select to set the color of the frame lines. In the frame lines definition file, lines can either be given a fixed color, or they can have the color specified as "User". If "User" is chosen for a line, the setting chosen in this menu section is applied to the line.

Intensity
Select to set the intensity of the frame lines. The higher the number, the brighter the frame lines appear.

User rectangles screen

User rectangles
Select to set user rectangles to Off, Rect 1, Rect 2 or Rect 1&2. The ALEXA can display up to two additional rectangles that can be adjusted manually.

Set rect 1
Select to set the shape of rectangle 1. Activate it through User rectangles.

Set rect 2
Select to set the shape of rectangle 2. Activate it through User rectangles.

Note: Default frame lines have "User" specified as color for all content.
False Color Index

Select False color index to display a reference chart showing the relationship between the color overlays, signal level in percent and descriptions. False color is available on the EVF-1 and over the MON OUT outputs.

<table>
<thead>
<tr>
<th>What</th>
<th>Signal Level</th>

*Figure 60: False Color Encoding*

12.1.5.3 Project

Sensor mode  
Select to set which sensor mode is active, 4:3 or 16:9.  
*Note: Only on ALEXA Plus 4:3, ALEXA Studio and ALEXA M.*

SxS resolution  
Select to set the current SxS recording resolution.  
Links to MENU>Recording>SxS CARDS.

Codec  
Select to set the current SxS recording codec.  
Links to MENU>Recording>SxS CARDS.  
*Note: When SxS is switched off, the currently active REC OUT format is shown.*

Project fps  
Select to set the timebase of the time code, which determines how many frames the time code counts per second and the frame rate of Quicktime clips recorded to SxS PRO cards during playback.

Camera index  
Select to set the camera identifier. Identifies the individual camera unit in clips and is reflected in clip names on SxS PRO cards.

Next reel count  
Select to set the reel number assigned to the next new SxS PRO card used for recording. The ALEXA automatically advances the reel number every time a new SxS PRO card is formatted on the camera. The reel number is reflected in clip names on SxS PRO cards.

Production info  
Select to open the PRODUCTION INFO screen where the user can enter metadata information specific to the production.
Note: The user should set the value of the Next reel count to 001 at the beginning of a shoot.

**Production Info**

The PRODUCTION INFO screen has fields to enter metadata information specific to the production. The user can enter the names of the director, cinematographer, location, production, scene and take. Two additional fields allow to enter other data.

- **Director**: Enter the name of the director
- **Cinematographer**: Enter the name of the cinematographer
- **Location**: Enter the name of the location
- **Production**: Enter the name of the production
- **Scene**: Enter the name of the scene
- **Take**: Enter the name of the take
- **User Info 1**: Enter other info
- **User Info 2**: Enter other info

**Menu > Project > Production Info**

</tbody>
</table>
Camera Controls

Power

| BAT1 (Plug) warning | Select to adjust the voltage level at which a power warning is displayed for the power source connected to the BAT plug. The level can be adjusted to match the battery type used. The default value is 21.0V. |
| BAT2 (Onboard) warning | Select to adjust the voltage level at which a power warning is displayed for the onboard battery. The level can be adjusted to match the battery type used. The default value is 12.0V. |

Note: When the voltage level reaches a point 10% below the warning level set in the POWER menu, the ALEXA displays a battery error message and recording is unavailable. The camera will read the voltage level as insufficient.

<table>
<thead>
<tr>
<th>MENU&gt;SYSTEM&gt;POWER</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAT1 (Plug) warning</td>
</tr>
<tr>
<td>BAT2 (Onboard) warning</td>
</tr>
</tbody>
</table>

Smart batteries that transmit their remaining load to the camera emit a warning at 10% remaining capacity and an error at 5% remaining capacity. Currently, batteries made by ID-X, Bebop, Anton Bauer and any battery using the TI-protocol support this feature.

External Sync

Eye index

Select to set the Eye index to left (L) or right (R). The first letter of the Camera ID will be changed to L or R for stereoscopic productions to identify left and right eye cameras. The eye index is reflected in clip names on SxS cards.

Sensor sync

Select to sync the sensors of two ALEXAs. See Sensor sync (on page 131) for more information.

- Off: The camera is in non-synced mode for regular use.
- EXT master: The camera sends signals to an EXT SLAVE camera via the EXT connector containing sync clock and TC signals.
- EXT slave: The camera receives signals from an EXT MASTER camera containing sync clock and TC signals through the EXT connector.

HD out phase

Select to adjust the phase of the REC OUT output in
the range of -30 to +30 HD clocks (1 HD clock = 13.4 ns). This can be necessary for 3D applications with external recorders that require the slave signal to arrive after the master signal. Shift the phase backwards (+) on a slave camera or forwards (-) on a master camera to achieve the correct signal order.

Send HD sync trigger
When using two cameras in sensor sync mode without settings sync, the EXT MASTER camera must send a trigger to the EXT SLAVE camera to ensure the HD outputs of the cameras are synced. Press the jogwheel to send the trigger.

Settings sync
ALEXA cameras can be operated in synced-settings mode, where the settings of two cameras can be synced via Ethernet. See Settings sync (on page 132) for more information.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Test Signal**

**Color bars**
Select to activate SMPTE color bars on MON OUT and REC OUT. The color bars are a 10-bit signal according to SMPTE RP 219-2002.

*Note: Color bar is switched off when recording is started.*

*Note: When REC OUT is set to ARRIRAW, REC OUT is set to black while color bar is active.*

**Test tone**
Select to activate a 1 kHz audio test tone on all channels when color bar is active.

*Note: Test tone is only active when audio recording is on and possible.*

**Test tone level**
Select to sets the level of the audio test tone to 0 dbFS, -9 dBFS or -18 dBFS.
**Camera Controls**

**Display + Beeper**

**Display brightness**
Select to adjust the brightness of the LCD display on the camera-right side. To adjust the display brightness when the HOME screen is displayed, press and hold the BACK button while rotating the jogwheel.

**Button brightness**
Select to adjust the brightness of the button illumination.

**Run beeper mode**
Select to set the Run beeper mode to:
- Off
- Start
- Stop
- Start+Stop

**System Time + Date**

**Time**
Displays the current time (read-only).

**Date**
Displays the current date (read-only).

**Set time + date**
Select to set time and date.

**Time zone**
Select to set the time zone to match your current location.

**DST**
Select to set daylight savings time.
Main Controls

Set time + date

**MENU>SYSTEM>TIME + DATE**

<table>
<thead>
<tr>
<th>Time</th>
<th>13:02:07</th>

Fan

Fan mode

Select to set the fan mode to Regular for locations with ambient temperatures up to 30°C (86°F). For locations with ambient temperatures higher than 30°C (86°F), set to Rec low.

SD card

**Format + prepare SD card**

Select to format the SD card and creates the required folder structure after confirmation.

*Note: This erases all data present on the SD card.*

**Prepare SD card**

Select to create or complete the required folder structure on the SD card without erasing any data present on the SD card.
Firmware

To keep the ALEXA up to date with new features, the camera firmware can be updated by the user. Download the latest Software Update Packet (SUP) from http://www.arri.com/camera/digital_cameras and be sure to read the included instructions.

To update the camera to a new SUP:

1. Copy the new SUP into the Firmware folder on an SD card formatted in the ALEXA. Load the SD card into the camera.
2. In the System menu, select Firmware.
4. Select the new SUP from the list on the FIRMWARE (SD CARD) screen.
5. Press both UPDATE buttons simultaneously to update the camera’s firmware.

Note: Do not interrupt the update once it has started. Make sure the camera power supply will remain sufficient for the duration of the update (app. 15 minutes).

Select update file  Select to update the camera’s firmware. If an SD card containing update files is loaded in the camera, you can select an update file from the list and perform an update.

Current version  Select to display the release code of current installed firmware.

Licensed features  Select to manage licensed features on the INSTALLED LICENSES screen.

Note: On rare occasions, the update process can fail. If the update procedure fails, try it again until you succeed.

Note: If SxS recording is switched off, switch it back on again before performing a firmware update.

MENU>SYSTEM>FIRMWARE

Select update file  >

(Current version: 4.0:14500)

Licensed features  >
12.1.5.4.1.1 Licensed Features

The capabilities of the ALEXA can be further enhanced through licensed features available for online purchase. Visit the ALEXA LICENSE SHOP at http://alshop.arri.de and follow the instructions for purchasing and downloading license keys. Available licenses include:

- DNxHD License Key
- High Speed License Key
- Anamorphic De-squeeze License Key

License keys are linked to each ALEXA's serial number and cannot be transferred from one camera to another. Before purchasing a license key, you must save the camera's hardware info file for upload during the purchasing process.

To save the hardware info file:
1. In the System menu, select Firmware.
2. Select Licensed features.
3. On the INSTALLED LICENSES screen, press the HW INFO button.
4. Press the SAVE button. The hardware info file will be saved on the SD card in the root directory. It will look like sn####-AlexaHardware.ipkg.

The INSTALLED LICENSES screen displays a list of installed licenses. New license can be installed from the SD card.

To install new licenses after purchase:
1. Copy the license key—it will have the suffix .lic—into the Licenses folder on an SD card formatted on the ALEXA. Load the SD card into the camera.
2. In the System menu, select Firmware.
3. Select Licensed features.
4. Press the INSTALL button.
5. On the LICENSE FILES (SD CARD) screen, select the license to be installed. The licensed feature enabled by the license key is described at the bottom of the screen for each license selected.
6. Press the jogwheel to install the license.

Note: Only license keys that have been created for the camera in use will appear in the SD card license list.
License keys can be deleted from the camera to prevent the use of the feature. The license can be reinstalled at any time.

To delete a license:
- On the INSTALLED LICENSES screen, press the DELETE button.
- Use the jogwheel to select the license you wish to delete.
- Press both DELETE buttons simultaneously.

Note: Keep an offline copy of the license key in a secure place! In the event of a lost license key, you can re-download it from your account in the ALEXA LICENSE SHOP.

12.1.5.5 Frame grabs

Still frames from the camera’s sensor can be taken. The still images inherit the REC OUT gamma and Look File settings. Available still image formats include .jpg, .tif and .dpx when the REC OUT is set to 422 or 444 output formats. When the REC OUT is set to ARRIRAW, only .ari format still frames can be taken. When the REC OUT acts as a MON OUT clone, frame grabbing is not available.

To set the still frame format:
1. In the Frame grabs menu, select File format.
2. Use the jogwheel to select the desired format and press the jogwheel to set it. Unavailable formats are grayed out.

To take a still frame and save it to the SD card:
- Press the GRAB button. The time needed for saving the image to the SD card will vary, depending on the file format. Additional still frames may not be taken while saving.

Still frames can also be taken by assigning User buttons 1, 2 or 3 to Grab still frame. This allows still frames to be taken from the operator’s side of the camera (camera-left side).

Still frames will be saved in the Grabs folder on the SD card.

MENU>FRAME GRABS

<th>File format</th>
<th>Jpeg</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compare grab 2 live image &gt;</td>
<td></td>
</tr>
</tbody>
</table>

Grabbed images inherit REC OUT settings!
A user setup is a profile of the current settings on the ALEXA that can be saved to the SD card. User setups can be given custom names, saved to the SD card and loaded onto multiple ALEXAs.

Rather than resetting the camera to its factory default settings, a user setup can be used to reset the camera to a user's default settings.

A user setup contains all parameters set in the camera except files that have been transferred via SD card, specifically frame lines and ARRI Look Files. These are not affected by loading a user setup and are only cleared by performing a factory reset.

Requirements:
- formatted SD card loaded in the SD card slot on the ALEXA

To create a user setup:
- Set all the desired parameters on the ALEXA.

To save a user setup:
1. Press the MENU button.
2. Use the jogwheel to select User Setups.
3. Select Save current setup.
4. To apply a custom name to your user setup, press the RENAME button. Erase the default user-setup name by pressing the CLEAR ALL button.
5. Use the jogwheel to enter a new name by scrolling to the desired character and pressing to select it.
6. When you have finished entering the new user setup name, press the DONE button.
7. Press the jogwheel to save the new user setup to the SD card.

To load a user setup:

1. Press the **MENU** button.
2. Use the jogwheel to select User Setups.
3. Select Load setup.

<table>
<thead>
<tr>
<th>SETUPS (SD CARD)</th>
</tr>
</thead>
<tbody>
<tr>
<td>DefaultSetup1</td>
</tr>
<tr>
<td>Highspeed_ARRI</td>
</tr>
</tbody>
</table>

4. Use the jogwheel to select the desired setup in the list and press the jogwheel to load the setup.
5. Press the **PROJECT** button to validate your project settings.

Note: User setups work only in the SUP version they are created in. After a SUP update, a new user setup must be created and saved.

A recommended procedure for working with user setups is as follows:

1. Before shooting, perform a factory reset to restore factory default settings.
2. Save a user setup named "Reset" or similar. This will be used instead of performing the ALEXA’s factory reset.
3. Adjust the camera’s shooting parameters and settings, and load the desired frame lines and ARRI Look Files.
4. Save another user setup with a descriptive name, such as "Show Title A-Cam".
5. To reset the camera to the default settings without losing the frame lines or ARRI Look Files, load the "Reset" user setup.

User setups can be used to ensure that cameras on multi-camera shoots have matching settings, or to transfer a show’s setup onto daily cameras, to ensure they carry the same shooting specifications. User setups can also be created for regular speed and high speed modes, eliminating the need to change settings individually after switching modes. For example, to switch from regular speed mode to high speed mode, the user can simply load the high-speed mode user setup that he created, saving production time.

Note: You cannot switch between sensor modes by loading a user setup. To switch sensor modes, go to the SENSOR menu or PROJECT menu.
12.2 Operator controls

The operator controls are located on the camera left side and consist of three function buttons plus three assignable buttons.

1. User button 1. Can be assigned functions with the USER button on the Main controls.

2. User button 2. Can be assigned functions with the USER button on the Main controls.

3. User button 3. Can be assigned functions with the USER button on the Main controls.

REC Press the REC button to start and stop internal recording. A red LED tally indicates recording.

PLAY Press the PLAY button once to load the last clip. Press the PLAY button again to toggle between play and pause. Press and hold the PLAY button for 2 seconds to stop playback.

LOCK Press and hold the LOCK button for 3 seconds (counted down on the main controls LCD) to lock the main and operator controls. A blue LED beside the LOCK button on the camera-left side indicates the lock is active. A lock icon on the LCD display on the camera-right side indicates the lock is active. Press and hold the LOCK button for 3 seconds to unlock the main and operator controls.

Figure 61: Operator UI
12.3 **EVF-1 Controls**

The EVF-1 controls are located on the electronic viewfinder. They consist of a number of function buttons and a jogwheel.

- **CAM**
  Press the CAM button to open the EVF-1’s CAM menu.

- **EVF**
  Press the EVF button to open the EVF-1’s EVF menu.

- **ZOOM**
  Press the ZOOM button to magnify the EVF-1 image 2.25x for focus check. The magnification ratio is 1:1, or one sensor pixel to one EVF-1 display pixel. Active magnification is indicated by an orange frame around the image. Frame lines are deactivated while zoom is active.

- **EXP**
  Press the EXP button to toggle false color display on and off.

When the LOCK button on the main controls is engaged, the CAM and EVF buttons are locked with the main controls and operator controls. The ZOOM and EXP buttons are not affected by the lock.

The message Button is locked! is displayed in the EVF-1 when the CAM or EVF button is pressed while the main controls are locked.

12.3.1 **Viewfinder EVF menu**

Press the EVF button to open a the Viewfinder EVF menu in the EVF-1 display and set the viewfinder parameters. Use the jogwheel on the EVF-1 to select and set menu options. Press the EVF button to exit the Viewfinder EVF menu.

- **Brightness**
  Select to set the brightness of the EVF from 1 (least bright) to 5 (brightest). A brightness level of 5 is recommended for normal shooting scenarios.
<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rotate image</td>
<td>When mounting the EVF to the right side of the camera, the image can be flipped to orient the image correctly in the viewfinder. Affects only the EVF image, MON OUT and recording images are not rotated.</td>
</tr>
<tr>
<td>Smooth mode</td>
<td>Select to set Smooth mode On or Off. With smooth mode on, the EVF image shutters less when panning. Note: Smooth mode is only possible with frame rates up to 30 fps and shutter angles of 180.0 or less.</td>
</tr>
<tr>
<td>Surround view</td>
<td>Select to set Surround view on the EVF-1 On or Off. When set to on, the additional pixels outside the recorded image area on the ALEXA’s ALEV III sensor are displayed, allowing the operator to see outside the recorded image and keep unwanted objects, such as microphone booms, out of the shot. To view only the recorded image, set Surround view to off.</td>
</tr>
</tbody>
</table>
| Surround mask          | Select to adjust the Surround mask settings. If surround view is set to On, it must be separated from the recorded image area to allow proper framing. Users can choose:  
  - Black line  
  - Color line  
  - Mask 25%  
  - Mask 50%  
  - Mask 100% |
| Status info            | Select to set Status info to On or Off. When set to On, camera shooting parameters are displayed across the top of the EVF-1’s image, outside the active image area and camera status information is displayed across the bottom of the EVF-1’s image, outside the active image area. |
| Framelines             | Select to set frame lines to On or Off. Frame lines are a reference for framing that typically consist of an image frame, a center mark and an aspect ratio reference. See the appendix for more information on the ALEXA frame line format. |
| Select framelines 1    | Select to set the main frame lines template from those stored in the camera. |
| Select framelines 2    | Select to set the secondary frame lines template from those stored in the camera. |
| Center mark            | Select to set the Center mark to Off, Dot or Cross to aid in image framing. |
| User rectangles        | Select to display up to two additional user-editable rectangles in the EVF-1 image. |
| Edit user rectangles   | Select to adjust the user rectangles. |
| Framelines color       | Select to set the color of the frame lines. |
| Framelines intensity   | Select to set the brightness of the frame lines. |
12.3.2 Viewfinder CAM menu

Press the CAM button to open the Viewfinder CAM menu in the EVF-1 display and set the camera parameters. Use the jogwheel on the EVF-1 to select and set menu options. Press the CAM button to exit the Viewfinder CAM menu.

**FPS**
Select to set the sensor frame rate. Preconfigured and previously added user-defined values can be selected in the FPS list.

**SHUTTER**
Select to set the shutter angle. Preconfigured and previously added user-defined values can be selected in the Shutter list.

**EI**
Select to set the exposure index. Settings from EI 160 to EI 3200 can be selected, in steps of 1/3 stop.

**WB**
Select to set the white balance. Preconfigured and previously added user-defined values can be selected in the WB list.

13 Operation of the Camera

This chapter covers tasks the user will encounter while using the ALEXA. While previous chapters contained specific procedures for basic use, this chapter will outline broader tasks and offer recommendations and best practices, including camera configuration.

13.1 Recording

13.1.1 Internal recording

This chapter contains information and recommendations for recording with SxS PRO cards. The user is encouraged to adapt the recommendations and workflow to individual and production needs.

Note: ARRI cannot be held responsible for the loss of any data in conjunction with internal recording!
The ALEXA records internally to Sony SxS PRO cards. The SxS PRO card uses the ExpressCard34 form factor and is available in 8, 16, 32 and 64 GB capacities.

Card file format

SxS PRO cards must be formatted in the camera before they can be used for recording. ALEXA uses the Universal Disk Format (UDF) file system. This file system is read-only for computers, which means data can be copied from the card to another device, but the data cannot be manipulated on the card itself.

Card preparation

The typical usage cycle of a card is:

1. Format
2. Record
3. Copy
4. Back up
5. Verify data
6. Format

Format  Before recording, cards must be formatted in the camera. The camera always performs a blank format, which means that the cards contain no meta data and are not assigned a reel number prior to recording the first clip. The camera auto-detects cards with an invalid file system and asks the user to format the card. The ALEXA uses the UDF file system. This file system is read-only for computer systems, which minimizes the risk of data corruption.

Record  When the REC button is pressed, the camera starts to write a clip to the card. With the first clip, the card is assigned a reel number. There is more information on file naming later in this chapter.

Copy  After recording to the card is finished, the data should be copied to another device to minimize the risk of data loss. The data should also be verified after copying using checksums to ensure that no errors have occurred during the copying process.

Backup  The data should ideally be copied to two physically separate destinations. The first copy should be the "working copy", and the second copy should be the "backup copy". These tasks can be done in parallel, as long as the end result is verified data on two independent devices.
Operation of the Camera

Format

Only when the data has been copied to two independent devices and verified, should the card be formatted to remove all data from it. As a recommendation, the person who verifies the primary and back-up copies should also format the cards, so that the camera crew only receives empty cards. This functions as a failsafe—they will be alerted if they receive a card with valid data on it and can catch a card that might not have been copied and backed up. The card can be formatted with any file system, as it has to be reformatted by the camera anyway.

Codec

ALEXA can record both Apple ProRes™ as Quicktime files and Avid DNxHD as MXF (OP1A) files.

Note: Recording in Avid DNxHD requires license key.

The Apple ProRes™ codec family consists of 5 different codecs:

<table>
<thead>
<tr>
<th>Name</th>
<th>Color coding</th>
<th>Data rate @ 30 fps</th>
<th>Recording time on 32 GB SxS PRO @ 30 fps</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProRes 422 (Proxy)</td>
<td>YCbCr</td>
<td>45 Mb/s</td>
<td>1 h 23 min</td>
</tr>
<tr>
<td>ProRes 422 (LT)</td>
<td>YCbCr</td>
<td>102 Mb/s</td>
<td>37 min</td>
</tr>
<tr>
<td>ProRes 422</td>
<td>YCbCr</td>
<td>147 Mb/s</td>
<td>25 min</td>
</tr>
<tr>
<td>ProRes 422 (HQ)</td>
<td>YCbCr</td>
<td>220 Mb/s</td>
<td>17 min</td>
</tr>
<tr>
<td>ProRes 4444</td>
<td>RGB¹</td>
<td>330 Mb/s</td>
<td>11 min</td>
</tr>
</tbody>
</table>

¹Without alpha channel (444 only)

²Apple ProRes™ is a variable bit rate (VBR) codec. This means that the available recording time depends on the image content. The recording time in the table is the minimum available recording time for a 32 GB SxS PRO card. When image content is easily compressed without loss of image quality, the available recording time can exceed the number given in the table.

Also note that the available recording time is given for a 32 GB SxS PRO card at 30 fps. A lower sensor frame rate will increase the available recording time, while a higher sensor frame rate will decrease it.

For a detailed table of available frame rates and possible codec/card combinations, please refer to the Chapter FPS on page 59.
DNxHD

The following Avid DNxHD codecs are available on an ALEXA with a valid DNxHD license installed:

<table>
<thead>
<tr>
<th>Name</th>
<th>Color coding</th>
<th>Data rate @ 29.97 fps</th>
<th>Recording time on 32 GB SxS PRO @ 29.97 fps</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNxHD 115/120/145</td>
<td>YCbCr</td>
<td>145 Mb/s</td>
<td>29 min</td>
</tr>
<tr>
<td>DNxHD 175x/185x/220x</td>
<td>YCbCr</td>
<td>220 Mb/s</td>
<td>19 min</td>
</tr>
</tbody>
</table>

DNxHD 115/120/145 has a bit depth of 8 bit. DNxHD 175x/185x/220x has a bit depth of 10 bit. The listed recording times are not dependent on image content.

DNxHD is a fixed bitrate codec. The codec naming convention indicates the codec's project frame rate:

- DNxHD 115 = 23.976/24 fps
- DNxHD 120 = 25 fps
- DNxHD 145 = 29.97 fps (30 fps is not available)
- DNxHD 175x = 23.976/24 fps
- DNxHD 185x = 25 fps
- DNxHD 220x = 29.97 fps (30 fps is not available)

For a detailed table of available frame rates and possible codec/card combinations, please refer to the Chapter FPS on page 59.

Choosing a codec

Selecting the right codec for the production is a crucial task. Choosing a codec with a high data rate, such as ProRes 4444, delivers the highest image quality, but lowers the available recording time on an SxS card.

- **ProRes 422 (Proxy)**: Use for on-set monitoring and proxy editing while the master is captured with an external device.
- **ProRes 422 (LT)**: Use for on-set monitoring and proxy editing while the master is captured with an external device and higher quality is required.
- **ProRes 422**: Use for basic television applications if images do not require color correction in post production.
- **ProRes 422 (HQ)**: Use for high quality TV applications requiring color correction.
- **ProRes 4444**: Use for cinema applications requiring color correction and visual effects work such as pulling mattes.
- **DNxHD 115/120/145**: Use for basic television applications, if images do not require color correction in post production.
Operation of the Camera

DNxHD 175x/185x/220x

Use for high quality TV applications requiring color correction.

Whenever possible, test the full workflow pipeline with the preferred codec before shooting.

Resolution

Shooting ProRes no longer limits the recording resolution to HD (1920x1080). Starting in SUP 7.0, two new 2K ProRes recording options are available.

In 16:9 sensor mode, available ProRes resolutions are:

- HD (1920x1080)
- 2K (2048x1152)

The 2K format is aimed at 2K DCI workflows and eliminates the need for up-scaling in post production.

In 4:3 mode, available ProRes resolutions are:

- 2K (2048x1536) only

Note: DNxHD only supports HD (1920x1080) resolution.
Card file format

**SxS PRO** cards must be formatted in the camera before they can be used for recording. The ALEXA uses the Universal Disk Format (UDF) file system. This file system is read-only for computers, which means data can be copied from the card to another device, but the data cannot be manipulated on the card itself.

CARD file structure

After formatting in the camera, **SxS** cards are named ARRI UDF until the first clip is recorded. Once a clip has been recorded, **SxS** cards are named with the camera index letter and reel number. Clips are stored in a folder with the same name as card.

In addition to the clips, recording writes an XML file that shares the card’s naming convention and the folder extension _FCP (example: A001R1JL_FCP.xml). The XML file is adheres to the Final Cut Pro (FCP) XML specification. If the XML file is opened in Final Cut Pro directly from the card, all clips are imported as one bin. If the clips are copied from the card to another destination, the file paths in the XML file have to be adjusted to match the new file location.

![Image of ALEXA SxS card opened in Mac OS X](image)

*Figure 62: Example of ALEXA SxS card opened in Mac OS X*

File naming scheme

ALEXA automatically names files as they are created on the **SxS** card. While it is possible to change the file names later on a computer, it is not recommended, as the ALEXA naming scheme has been developed to minimize the risk of duplicate file names.

The file name consists of 6 parts:

- **Camera Index**: One character, A-Z. User assignable, should match the camera unit. For example, the camera index A can be assigned to the A camera, and B to the B camera.
• Reel Counter: 3 characters, 001-999. Auto-assigned to each card, automatically advanced by one for each new card. The user can change the counter for the next reel (card). This should only be done under special circumstances, such as after changing the camera body in the middle of a shoot.

• Clip Index: One character, fixed to C. Main use is to separate the reel counter from the clip counter. If more than 999 clips are recorded to one card (not likely to happen), it changes to D.

• Date: Current date, in order YYYYMMDD, as set in Menu>System/Time/Date.

• Camera ID: Consists of a one letter prefix, user-adjustable between R and L, and the camera serial number encoded in 3 letters Base36 (0-9, A-Z).

The date is separated by underscores at the beginning and end.

The reel counter should be set to 001 at the beginning of a shoot. The camera will then automatically advance the reel number each time a new SxS card is loaded into the camera, formatted and recorded on. If a previously recorded card is reloaded in the camera (comparable to a short end of a film roll), this card will keep its reel number and the camera will remember how far it has counted. The next new SxS card will inherit the correct next reel number. To change the next reel number manually, select Next reel count in the Project menu. Note that this is only recommended for special circumstances.

Examples

A typical ProRes/Quicktime file name would look like this:

• A004C010_20100610_R1JL.mov

A typical DNxHD/MXF file name would look like this:

• A004C010_20100610_R1JL.mxf

The translation of this clip name is as follows:

• this clip was the tenth clip recorded on the fourth card used (reel number)
• this clip was recorded on June 10, 2010
• the camera assigned the Base 36 serial number 1JL, which translates into the decimal serial number 2001 (For a Base 36-to-decimal converter, visit http://www.translatorscafe.com/cafe/units-converter/numbers/calculator/decimal-to-base-36/ or conduct an internet search.)

Additional recommendations

To minimize the risk of lost data, ARRI suggests the following guidelines for SxS card and data management:
• Pre-format cards. Format all the SxS cards in the camera before shooting begins. This can save production time otherwise used formatting cards at every reload. Cards do not receive a reel number until the first clip is recorded, so there is no need to use the cards in the same order they were pre-formatted. Formatting a 32 GB card normally takes less than 10 seconds.

• Limit the recording time on each card. Codecs with lower data rates like ProRes 422 (Proxy) have long record times on high-capacity SxS PRO cards. Users should consider limiting the recording time to 30 minutes of material per card to make managing the data more efficient and reduce the impact on the production in the event of a problem.

• Download and back up data immediately after reloading the camera to minimize the time that data exists in a one place (the SxS card).

• When a full SxS card is removed from the camera, switch the card's write protect tab to on (red indicator) before sending it to the data wrangler.

• After an SxS card has been downloaded and backed up, switch the card's write protect tab to off before formatting.

Metadata

Metadata is stored in the index.xml file as well as the Quicktime file header. The most important metadata for post production workflow is the tape name, as it will be one of the primary identifiers used in the EDL. The term tape name is an existing post-production naming convention that is also used for nonlinear media. The term reel name may also be used.

The tape name of ALEXA files is limited to 8 letters to match the CMX 3600 EDL standard. It consists of the Camera Index, reel counter and the Camera ID. Based on the previous example, the tape name of the clip would be A004R1JL.

Even if the user forgets to assign different camera indices to two cameras on the same project, the Camera ID metadata guarantees unique tape names.

The Quicktime file carries a single timecode track.

In DNxHD/MXF files, metadata is stored as an .ale file on the SxS cards, and in an XML file embedded in the MXF.

For more information, please refer to the Metadata white paper available for download on the ARRI website.

Dual recording

The Dual recording function in the ALEXA allows recording to two SxS PRO cards in parallel, creating an instant backup at the time of recording. To enable dual recording, set Dual recording to On in the SxS CARDS menu (in Recording menu).

Requirements for dual recording:

The SxS PRO cards must be of the same capacity.

• When reloading, or changing reels, both cards must be formatted.
The SxS PRO cards must have identical file structure. Follow the procedures for normal recording to a single SxS PRO card, but manage the SxS cards as a set. Download and back up one card and keep the other card as an additional backup.

13.1.2 External recording

In addition to internal recording, the ALEXA can also output uncompressed HD and unprocessed ARRIRAW data to external recorders over the REC OUT.

Choose the preferred output format based on the following basic guidelines:

- 422 1.5G: use for television applications that require only color correction and high-speed capture above 30 fps.
- 444 1.5G: Use for high-quality television applications that require color correction and visual effects work such as pulling mattes, and for cinema applications.
- ARRIRAW: Use for high-quality cinema applications destined for multi-format distribution.

422 1.5G YCbCr

422 is a format in which color is sub-sampled, meaning that the camera-native RGB image is transformed to a YCbCr color space. Y represents luminance, while Cb and Cr are color difference signals. Cb and Cr are sampled with only half the horizontal resolution, as the human eye is less sensitive to color resolution than to luminance resolution. 422 is a good balance of lower bandwidth in transmission and high quality visual results.

For frame rates up to 30 fps, 422 1.5G is transmitted over a single HD-SDI cable. REC OUT 1 and REC OUT 2 carry the identical signal independently. When shooting frame rates higher than 30 fps, the signal is split across both REC OUT 1 and REC OUT 2 and requires connecting two HD-SDI cables.

422 3G YCbCr

3G is an improved HD-SDI format that can transmit signals over a single cable which previously required two cables. It transports the same signal as 422 1.5G YCbCr dual link, but over one cable with a higher clock rate. REC OUT 1 and REC OUT 2 carry the identical signal independently.

444 1.5G RGB

444 is still in the RGB color space, with each color at its full resolution. This is important when chroma keying, as these composites rely on color resolution.

444 1.5G is transmitted over two HD-SDI cables, with each cable carrying part of the image data. It is important to
- connect REC OUT 1 on the camera with record input 1 (or A) on the external recorder and REC OUT 2 on the camera with record input 2 (or B) on the external recorder
- use matched lengths of HD-SDI cables for links 1 and 2

444 3G RGB

There are two types of 444 3G signal.
- The single link version contains the same signal as the 444 1.5G signal, but according to SMPTE 425M over a single cable.
- The dual link version uses a proprietary image mapping for frame rates from 30 to 60 fps, and is only currently supported by certain recorders.

ARRIRAW 1.5G DL

ARRIRAW is the proprietary raw data generated by ARRI cameras. Raw data is the sensor image data before it is converted to RGB images. The ALEXA has a single sensor with a Bayer pattern color filter array, meaning that every pixel has only one channel of color information.

With normal HD images, the missing color channel information is calculated from the adjacent pixels in the camera.

With raw data, this calculation is delayed until after the recording to save bandwidth and creative options. Shooting ARRIRAW allows many decisions on how to convert the images to be made in post-production.

ALEXA ARRIRAW specs:
- Bayer pattern color coding
- 12 bit log luminance coding
- No white balance applied
- No exposure index applied
- Full sensor resolution (2880x1620)

ARRIRAW is transmitted to the recorder via ARRIRAW T-Link using standard HD-SDI dual link cables with proprietary encoding. The HD-SDI signal complies with the SMPTE 372M standard.

An ARRIRAW T-Link-certified recorder must be used for recording ARRIRAW. Certified recorders are available from Codex, Keisuko Giken and S.Two, among others.

For more information, visit http://www.arri.de/arriraw

ARRIRAW 3G SL

The ARRIRAW 3G SL signal format uses a single HD-SDI signal that complies with the SMPTE 425M standard. It is similar to ARRIRAW 1.5G DL, but uses only one cable.
ARRIRAW 3G DL

This output format is fully proprietary and does not follow SMPTE standards. It is used to transmit ARRIRAW with frame rates between 30 and 60 fps.

Note: Only use double-shielded HD-SDI cables on all HD-SDI outputs to ensure error-free data transmission!

Triggers record on an external recorder

When SxS recording is set to Off, the REC button triggers only the SDI record flag, signaling the recorder to start and stop recording.

The SDI record flag is an ancillary data packet in the blanking area of the HD-SDI signal that contains information about active recording. This packet is always embedded in the HD-SDI signal.

Note: With the SDI record flag, successful recording cannot be guaranteed, as there is no feedback from the recorder to the camera.

13.1.3 Parallel recording

Recording to both SxS PRO cards and external recorders simultaneously offers additional workflow options. For example, the SxS PRO recording can be used for dailies and proxy editing, while the external recorder captures the master data. In another scenario, the internal recording can be used for TV broadcast and the ARRIRAW captured on the external recorder can be used for theatrical distribution.

Remote controlling the external recorder

Whenever the camera switches between record and standby mode, it triggers the SDI record flag on the REC OUT connectors, signaling an attached recorder to start or stop recording. The SDI record flag is an ancillary data packet in the blanking area of the HD-SDI signal that contains information about active recording.

Note: There is no feedback channel providing information to the camera if the external recording is active. Check the external recorder directly to determine whether or not recording is active.

Timecode on external recorders

To keep timecode locked across the SxS PRO card and the external recorder when recording in parallel, configure the external recorder so that it uses the TC embedded in the HD-SDI stream from the camera.
13.1.4 **High Speed recording**

When a valid High Speed license key is installed, frame rates of 60 to 120 fps are enabled in High Speed mode. High Speed recording is only possible on SxS PRO cards with ProRes™ codecs up to ProRes 422 HQ in HD (1920x1080) resolution. ProRes 4444 is not available in High Speed mode.

For a detailed table of available frame rates and possible codec/card combinations, please refer to the Chapter FPS on page 59.

The REC OUT carries the same signal as the MON OUT during High Speed mode.

Note: Camera boot-time is increased by approximately 40 seconds when High Speed mode is active during a power-cycle.

13.2 **Monitoring**

The ALEXA’s monitoring options are the electronic viewfinder EVF-1 and the MON OUT. Surround view is available on both. With surround view set to On, 10% additional pixels outside the recorded image area on the ALEXA’s ALEV III sensor are displayed, allowing the operator to see outside the recorded image and keep unwanted objects, such as microphone booms, out of the shot. To view only the recorded image, set Surround view to off.

To aid in framing, both the EVF-1 and MON OUT can display frame lines overlaid on the image. Frame lines can be considered electronic versions of ground glasses in film cameras.

13.2.1 **Frame Lines**

Frame lines are stored as XML files. A standard set of frame lines is provided in each camera, including:

- 1.33:1
- 1.66:1
- 1.78:1
- 1.85:1
- 2.39:1
- 2.39:1 2.0x anamorphic

Note: When shooting ProRes 2K (2048x1152) for a DCI 2K release in a 1.85:1 aspect ratio, the preloaded frame line ARRI 1.85 2K DCI can be used to mark the corresponding 1998x1080 area for a DCI 2K 1.85 without requiring any scaling in post production. Do not use this frame line in ProRes HD (1920x1080).

The user can also create custom frame lines to match production specifications.
Description of the frame lines XML file

The different sections in the file are:

- **camera**: describes the ALEXA model that the frame lines file is made for.

- **line**: frame lines and the center cross in the active image area consist of single lines. The line orientation is defined by three attributes: left, right, bottom and top for horizontal lines, top, bottom, left and right for vertical lines. Two attributes define the start and end points, and the third attribute defines the distance from the image edge.

- Distances for start, end and position are relative to the width or the height of the image and have a precision of 5.

- To create a centered frame line with a center cross as in the example, a total of six lines is necessary.

- To calculate the position of a line for a given aspect ratio, use the following formulas:
  - horizontal lines for aspect ratios >1.78 (e.g. 1.85): \[1 - \frac{(1.78/\text{Aspect})}{2}\] = distance from bottom or top
  - vertical lines for aspect ratios <1.78 (e.g. 1.33): \[1 - \frac{(\text{Aspect}/1.78)}{2}\] = distance from left or right
XML example

The following sample XML code illustrates the frame lines system. It describes frame lines for a 2.35 centered aspect ratio inside the camera's 1.78 recorded image.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!-- NOTES: All widths are in pixels. All colors can be one of: black, white, or user. If you select user, the color can be changed through the user interface. You can add as many lines as you like. Lines are defined by giving 3 distances from the border. So if you specify top, left and right it will be a horizontal line with the given distance from left, right and from the top. The values are in the range \([0, 1]\), where: 0 is at the edge 1 is on the opposite edge So specifying 0.4 from left is the same as 0.6 from right. -->
<framelines>
<!-- The description of the camera, this will only be used for selecting the correct files. So the user can only select glasses for his camera/current setup. -->
<camera>
  <type>Alexa EV</type>
  <sensor>3K</sensor>
  <aspect>1.78</aspect>
  <hres>2880</hres>
  <vres>1620</vres>
</camera>

<!--user color line at top and bottom of 2.35 aspect-->
<line>
  <left>0</left>

</line>
```

[71x790]Monitoring [522x790]127
13.2.2 Status Info Overlays

The ALEXA can display camera status information on both the MON OUT and EVF-1.

At the top and bottom of the screen, the ALEXA displays textual status information. The top status bar consists of sensor FPS, shutter angle, exposure index and white balance. In the EVF-1, the status bar also works as a menu, allowing the user to change the values when the CAM button is pressed.

The bottom status bar displays information about the battery levels, recording/standby flag and remaining capacity of internal storage.

On the left and right of the screen, icons provide information about the current status of the camera. The icons are organized into groups.

The left icon group is labeled SYS and contains information about the general system state of the ALEXA. On the right side, there are three groups labeled MON, EVF and LOOK. They provide specific information about the MON OUT, EVF-1 and the application of ARRI Look Files.

The following table explains the icons in the SYS group:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="HD" /></td>
<td>Indicates that the current recording resolution is set to HD.</td>
</tr>
<tr>
<td><img src="image" alt="2K" /></td>
<td>Indicates that the current recording resolution is set to 2K.</td>
</tr>
<tr>
<td><img src="image" alt="i" /></td>
<td>Indicates that there is a warning condition in the camera.</td>
</tr>
<tr>
<td><img src="image" alt="i" /></td>
<td>Warns that the camera has detected an error.</td>
</tr>
<tr>
<td><img src="image" alt="thermometer" /></td>
<td>Indicates that the camera temperature is outside of its optimal range.</td>
</tr>
</tbody>
</table>
Using Timecode

Timecode ensures that every image of recorded media can be identified with a unique value and synced with corresponding media, such as sound or the second camera in a 3D application. When used with other metadata, such as reel names, all recorded media maintains its unique identity.

Following are two ways timecode can be used on a production:
External TC, Time of day

- **Use:** This format is often used on multi-camera productions with sync-sound. When all cameras are running at sync-sound speed, which is also the project frame rate, sound and image time code match and allow for easy syncing in post.

- **Setup:** The sound department acts as the timecode master, and generates timecode which uses the time of day as a value, and a time base matching the project frame rate. Twenty-four hours of time will translate into twenty-four hours of time code. Timecode is fed to the camera via the TC connector. The timecode source must be set in the camera to Ext LTC and the mode to Free Run. The project fps setting must match both the sensor frame rate and the time base of the external timecode signal. The camera can be set to use Jam sync generator, in which it samples the timecode value once and then continues counting based on its own high-precision crystal clock. The timecode source can be disconnected from the camera after jamming in Jam sync generator mode. This mode ensures stable timecode with an offset of less than one frame for each eight hours, after which the camera has to be re-jammed. Alternatively, the camera can be set to regenerate mode, or Regen on the TIMECODE OPTIONS screen. In Regen mode, the camera uses the timecode value of the external timecode source. This ensures correct timecode for an infinite duration, but the timecode source must remain connected to the camera.

- **Variations:** If shooting starts close to midnight, the timecode might be started with an offset time of day to prevent a rollover at midnight.

- **Restrictions:** External timecode is only possible if the camera is running at sync-sound speed. If the camera is over- or under-cranking, the timecode frame rate will no longer match the sensor framerate, and timecode values would either be duplicate or dropped. To prevent this, the ALEXA will automatically switch to Int TC source and Regen mode when the sensor frame rate is changed.

Internal TC, Rec Run

- **Use:** Record run timecode is often used on single camera productions that are either MOS or use a dumb slate to sync picture and sound. Record run timecode guarantees continuous timecode on all recorded data. Record runtime code also works with over- and under-cranking.

- **Setup:** The timecode source must be set to Int TC, the mode to Rec Run and the generator to Regen. Timecode counts up only during recording, by one frame for each image generated by the sensor. The timecode counts at the project frame rate set on the camera. Normally, the timecode hour value advances by one hour for each new reel, using only hours 01-20 for reel 1-20, and then restarting at hour 01 for reel 21.

- **Variations:** Record run timecode might be used for off-speed work on productions that use external timecode sources for all sync sound.

- **Restrictions:** None.
13.4 Syncing the Sensors of Two Cameras

Two ALEXAs can be synced for 3D applications or any application requiring sensor sync using the EXT connectors and corresponding cable. When synced, images are captured from each camera's sensor at precisely the same time.

Note: Syncing two sensors is possible at frame rates between 1.000 and 60.000 fps.

To sync the sensors of two ALEXAS:

1. Connect an EXT cable KC 155-S to the EXT ports on each ALEXA.
2. In the System menu on the master camera, select External Sync.
3. On the EXT SYNC screen, set Sensor sync to EXT master.
4. In the System menu on the slave camera, select External Sync.
5. On the EXT SYNC screen, set Sensor sync to EXT slave. It takes approximately five seconds for the two ALEXAs to sync.

The master camera triggers the slave camera so that images are created at the same moment of time with an accuracy of 10 μs. Whenever an error occurs, the camera will issue a warning.

Image integration between master and slave camera has a locked offset of less than 10 μs. This means that in the worst case, exposure differs by 4.3% (@ 60 fps frame rate and 5.0° shutter angle). With a regular exposure time (24 fps, 172.8°), the maximum difference is 0.05%.

Synchronizing Image Output

The REC OUTs and MON OUTs of two ALEXAs can also be synchronized. To achieve this, the user must send a trigger from the master camera to the slave camera after sensor sync is established.

To sync the REC OUTs and MON OUTs of two ALEXAs:

1. Ensure that the sensors of the two ALEXAs are synced.
2. In the System menu on the master camera, select External Sync.
3. On the EXT SYNC screen, select Send HD sync trigger.
4. Press the jogwheel to send the trigger to the slave camera. The camera will display the message HD sync trigger sent to slave camera! If the sensors are not synced, the camera will display the error message Trigger not sent. Camera must be set to Ext sync: Master!.

After the sync trigger has been sent, the slave camera will no longer display the warning HD outs not synced. Trigger now!.

If the two cameras' settings are synced over Ethernet, the trigger is automatically sent.

When the outputs are synced, jitter between the two cameras' HD outputs is less than 500 ns. The HD output of each camera can be advanced or delayed by up to 30 HD clocks (1 HD clock= 13.46 ns), allowing for a total shift of 60 HD clocks (808 ns total) between cameras.
13.5 Syncing the Settings of Two Cameras

Two ALEXAs can be operated with synchronized settings. ARRI recommends to sync the settings ALEXAs of the same model only, for example, two ALEXA Plus models.

Camera connection

The settings of two ALEXAs can be synchronized over ethernet using the ALEXA Ethernet/Ethernet Cable KC 156-S, or over an ethernet hub using the ALEXA Ethernet/RJ-45 Cable KC 153-S.

Camera setup

To sync the settings of two ALEXAs over Ethernet:

1. Connect an ALEXA Ethernet/Ethernet Cable KC 156-S to the EXT ports on both ALEXAs, or an ALEXA Ethernet/RJ-45 Cable KC 153-S to the ethernet hub and the EXT port of each ALEXA.
2. In the System menu on the master camera, select External Sync.
3. On the EXT SYNC screen, set Settings sync to ETH master.
4. In the System menu on the slave camera, select External Sync.
5. On the EXT SYNC screen, set Settings sync to ETH slave. The two ALEXAs will automatically negotiate IP addresses. It takes approximately five seconds to establish a connection.

The master camera will initially distribute its settings to the slave camera. Once this is done, settings can also be changed on the slave camera, and the change will take effect on both cameras. This is useful if the master camera's controls are not accessible.

If a camera is set to ETH master or ETH slave, but is not connected to another camera, a warning is displayed on the STATUS Info screen.

Synced settings

The following settings are synced when syncing two ALEXAs:

- WB>White Balance + CC Tint
- EI>Exposure Index
Syncing the Settings of Two Cameras

FPS>Sensor FPS

MENU>Monitoring>MON OUT>Surround view
MENU>Monitoring>MON OUT>Surround mask
MENU>Monitoring>MON OUT>Framelines
MENU>Monitoring>MON OUT>Anamorphic desqueeze

MENU>Project>Project fps

In addition, the slave camera takes over the Camera ID of the master camera, so file names are identical except for the Camera ID prefix. It is important to give the master and the slave camera different Camera ID prefixes to prevent duplicate file names.

¹Valid license for anamorphic desqueeze must be installed on both cameras.

²Valid license for SxS High Speed recording must be installed on both cameras.

13.6 Sensor modes 16:9 and 4:3

The ALEXA M, ALEXA Plus 4:3 and ALEXA Studio have ALEV III sensors and can be operated in 16:9 or 4:3 mode.

Note: ALEXA and ALEXA Plus can only be operated in 16:9 mode.

To change the sensor mode:

1. In the System menu, select Sensor.
2. Select Sensor mode. The current sensor mode is indicated on the top line on the SENSOR screen.
3. Press the jogwheel to select 16:9 or 4:3 sensor mode.
4. Press the LOAD buttons simultaneously to load the new sensor mode. Loading the new sensor mode takes approximately 30 seconds including a mandatory camera reboot. A progress bar indicates the sensor mode loading progress.

<table>
<thead>
<tr>
<th>MENU&gt;SYSTEM&gt;SENSOR</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sensor mode</td>
</tr>
<tr>
<td>Sensor temperature</td>
</tr>
<tr>
<td>Mirror image horizontal</td>
</tr>
</tbody>
</table>
Note: Switching from 16:9 to 4:3 and vice versa always includes a factory reset.

When using 4:3 mode, there are some important restrictions:

- **SxS** recording is only possible with ProRes codecs in 2K (2048x1536) resolution.
- The REC OUT output can only be set to the ARRIRAW format.
- No High Speed mode is available in 4:3 sensor mode. When switching to High Speed mode, the sensor mode automatically switches to 16:9.

The current sensor mode can also be checked on the SYSTEM INFO screen by pressing the INFO button and SYSTEM button.
14 ALEXA Plus

14.1 General Description

The ALEXA Plus has a unique side cover that contains extended electronics and offers the following additional functions over the standard ALEXA:

- Built-in radio modem for wireless remote control of lens and camera
- A level sensor to determine the camera's tilt and roll in degrees
- Three CLM ports for driving CLM-2, CLM-3 or CLM-4 motors
- Two LCS bus interfaces for connecting WCU-3, WHA-3 and ZMU-3 hand units
- LDS Lens Data System for reading lens data from LDS lenses
- Depth of field calculation for LDS lenses and LDA (Lens Data Archive) lenses in combination with calibrated lens motors
- LDD (Lens Data Display) interface
- Lens Adapter PL Mount LA-PL-2 with LDS support
- Control of LDS, radio, and lens motors through the camera user interface
- A third RS socket
- A second MON OUT output
- An additional function button labeled WRS (Wireless Remote System). It gives access to the WRS screen, from where all camera settings related to the Plus camera features can be adjusted.

Any ALEXA can be upgraded to an ALEXA Plus by installing the Plus module.

Note: The Plus module must be installed by an authorized ARRI service center only.

Figure 63: CLM sockets
14.2 Optics

14.2.1 Lens Adapter PL-Mount LA-PL-2 (with LDS)

The ALEXA Plus lens mount supports the ARRI Lens Data System. An LDS lens must be mounted in the 12 o'clock or 3 o'clock position to enable the LDS functions. Take care not to damage the LDS contacts on the lens and the camera when mounting or unmounting a lens or lens port cover.
Apart from the LDS feature, the same procedures as with the LA-PL-1 apply.

![Figure 65: Lens adapter PL-Mount LA-PL-2 (with LDS)](image)

### 14.3 Radio System

The ALEXA Plus module contains a radio unit that enables wireless lens control, lens data communication and remote control of basic camera functions. There are two radio systems available for the ALEXA: yellow radio and white radio.

#### 14.3.1 Yellow Radio

The ALEXA Plus can be equipped with the yellow radio system, which has commonly been used on ARRI film cameras. It may be a cost-effective option for rental companies that already own equipment with yellow radio. ALEXAs equipped with yellow radio would communicate with their existing inventories of yellow radio wireless control units without hardware updates or modification. Yellow radio can be identified by a yellow ring at the base of the antenna mount.

Note: Only a limited supply of yellow radio units is still available. Yellow radio is no longer produced and will no longer be available once all existing units are sold.
### 14.3.2 White radio

The ALEXA Plus is equipped with the white radio system as standard. It has eight available channels. White radio can be identified by a white ring at the base of the antenna mount point.

<table>
<thead>
<tr>
<th>Channel</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>2.410 GHZ</td>
</tr>
<tr>

</tr>
<tr>
<td>6</td>
<td>2.470 GHZ</td>
</tr>
<tr>
<td>7</td>
<td>2.475 GHZ</td>
</tr>
</tbody>
</table>

White radio and yellow radio cannot be mixed in the same radio network of camera and hand units. It is possible to use both systems in parallel within different radio networks.

Up to three hand units can be connected to one camera in parallel to form a radio network.

Note: When a camera is set to "Sensor sync: EXT slave", its radio module automatically switches itself off, and the camera receives CLM control commands from the Master camera via the EXT cable.

### 14.4 Wireless Remote System

#### 14.4.1 Lens Motors

The ALEXA Plus supports ARRI CLM-2, CLM-3 and CLM-4 motors. CLM-1 motors are not supported. CLM-2, CLM-3 and CLM-4 motors can be used in a mixed setup.
Note: Use only one lens motor per lens axis.

Lens motors should be connected, according to their position on the lens, to the IRIS, FOCUS and ZOOM sockets on the camera-right side.

Motor calibration

After connecting a lens motor to the camera and the lens, it must be calibrated. The lens motor must be recalibrated under the following conditions:

- when the lens motor is detached from the lens
- after a camera reboot
- after changing lenses
- after a change in motor position while powered down

Note: Omitting motor calibration might lead to damage of the lens due to the high level of motor torque.

Motor direction

The direction of the motors can be set in the ALEXA's menus.

To set the direction of a motor:

1. Press the WRS button.
2. Select the lens by pressing the IRIS CLM, ZOOM CLM or FOCUS CLM button.
3. Press the LEFT or RIGHT button to set the direction of the lens motor.

Motor torque

For CLM-3 and CLM-4 motors, the motor torque can be set in the ALEXA's menus.

To set the torque on a CLM-3 or CLM-4 lens motor:

1. Press the WRS button.
2. Select the lens by pressing the IRIS CLM, ZOOM CLM or FOCUS CLM button.
3. Press the +1 or -1 buttons to increase or decrease the motor's torque. Available torque settings are 1 to 4, with 1 being the lowest torque level.

Note: Ensure that the motor torque level matches the lens to avoid lens damage.
3D lens sync

When two ALEXA Plus cameras are set to Sensor sync EXT master and EXT slave, the slave camera will switch off its radio module and receive motor control commands from the master camera over the EXT connection.

Note: Matching of the master and slave cameras' lenses in terms of focus, iris and zoom ring positions depends on the mechanical accuracy of the lenses. Make sure the lenses in use are matched as closely as possible.

14.4.2 Hand Units

For detailed information of the hand units, please refer to the device's own manuals.

Wireless Compact Unit WCU-3

The WCU-3 is a compact hand unit featuring a radio system to connect to the camera wirelessly. It has two LCS ports for connecting the device to the camera via cable and to attach a ZMU-3. A wheel and a slider can be used to control focus and iris axes. Zoom axis can be controlled by attaching a ZMU-3 at an LCS port.

The WCU-3 also has a display where it shows current fps, shutter angle, exposure index and white balance of the camera.

Wireless Main Unit WMU-3

The WMU-3 is a radio system for wireless connection to the camera. Both WFU-3 and WZU-3 can be attached to the WMU-3.

Wireless Focus Unit WFU-3

The WFU-3 has a knob and a slider that can be used to control focus and iris axes. It connects to the camera through a WMU-3 or a WHA-3.

Wireless Zoom Unit WZU-3

The WZU-3 controls the zoom axis. It connects to the camera through a WMU-3 or a WHA-3.

Wired Hand Adapter WHA-3

The WHA-3 allows both WFU-3 and WZU-3 to connect to the camera via cable.
Zoom Main Unit ZMU-3

The ZMU-3 controls the zoom axis. It can be connected to the camera via cable to an LCS port, or via cable through an LCS port of an WCU-3, or wirelessly by using a WZE-3.

Wireless Zoom Extension WZE-3

The WZE-3 is a radio system that enables direct wireless connection of a ZMU-3 and a camera.

Hand Unit Priorization

Different priority levels are assigned to the hand unit devices to ensure only one device has control over a motor at a time.

A device's knob that is assigned to an axis has a higher priority than a device's slider assigned to the same axis. When steering items of the same type are assigned to the same axis, the one connected via WRS has highest priority, second highest priority has a device cable on the upper LCS port, the lower LCS port has the lowest priority. Of two radio devices with the same steering items assigned to the same axis, the one that connects to the camera first gains control.

Cabled devices can gain control of an axis at the time of connection. Wireless devices must be rebooted if an axis has become idle before they can gain control.

An exception to the rule are devices on the zoom axis. Here the cabled devices have the highest priority, with LCS port 1 having priority over LCS port 2.

14.5 Lens Data Display LDD-FP

The Lens Data Display for Focus Pullers LDD-FP can be used to display lens information. Connect it to the LDD port of the Plus module.
14.6 Plus Camera Controls

The ALEXA PLUS has an additional function button labeled WRS. It gives access to the WRS screen, from where all camera settings related to the Plus camera features can be handled.

The WRS screen gives an overview of radio status, camera level, LDS status, and CLM status. The screen buttons lead to screens containing more detailed info on these topics and where settings can be changed.

Figure 67: WRS radio screen

CAM LEVEL

Shows the tilt and roll of the camera in degrees as measured by the camera's position sensor. This sensor can be reset if it appears to have an offset. Press the CAM LEVEL screen button to access the reset screen. By pressing the two lower outer screen buttons simultaneously, the sensor is reset.

Note: The sensor can only be reset while both axis are within a threshold of +/-10
degrees around 0.

---

**1. Level camera**

- Tilt: 0.0°  Roll: 0.0°
- Reset threshold OK

**2. Reset motion sensor**

Press both buttons!

---

*Figure 68: Motion sensor reset screen*

---

**LENS DATA**

Shows the type of LDS lens connected and the LDS status. The LENS DATA screen button leads to the LDS screen, where lens info like lens type, current focal length, iris, focus distance and close and far point of depth of field are shown.

The OPTIONS screen button opens the LDS options screen, where the LDS unit can be switched between imperial and metric, and the circle of confusion for correct calculation of depth of field can be set.

Note: After connecting a new LDS lens, turn all lens rings slowly until all lens axes have transmitted their current positions.

---

**85.0mm t 16.5**

**1.0m**  **4.8m**

**3.1m**

**ARRI Zeiss UP85 T1.8**

---

*Figure 69: LDS info screen*

---

**LDA**

When a non-LDS lens is connected, the user can achieve LDS functionality by using the Lens Data Archive. In the LDS screen, a button labelled LDA appears except when a LDS lens is connected.
The LDA consists of a user list and a main archive list. The user list should only contain the lenses currently used to achieve quick access to the desired lens tables. The main archive contains a set of lens tables for ARRI/Zeiss Highspeed, Master Primes and Ultra Primes and can be extended with additional lens tables for any PL-Mount lens.

![Image of User LDA](image1.png)

**Figure 70: User LDA**

Note: Custom lens tables may have to be created manually beforehand.

Pressing the LDA button opens the User LDA. Select a lens table and press the wheel. After calibrating the lens motors, the LDS functionality can be used.

To add a lens table from the main archive, access the User LDA screen and press the ADD button. This opens the Main LDA list. From the main archive, first select a lens type, the a lens model and then a lens class. The lens class can be found on the lens barrell below the infinity symbol of the focus scale. Then select to add the lens table to the user list (Press ADD), use it without adding (USE), or both (ADD+USE).

![Image of Main LDA](image2.png)

**Figure 71: Main LDA screen**

To delete a lens table from the user archive, access the user list and press the DELETE button. Select the lens table to delete and press the two buttons labelled DELETE simultaneously. Repeat this procedure to delete further lens tables.
Custom lens tables can be added to the main archive via the SD card. Place the lens table on the SD card in a folder named “LDA”. Insert the SD card into the camera. Go to the main archive list and press ADD. Select the desired lens table and press the wheel. The lens table will be located in the main archive as lens type “Custom”.

To delete a custom lens table from the camera, go to the main archive list and press DELETE. Select the lens table and press the two buttons labelled DELETE simultaneously. Repeat this procedure to delete further custom lens tables.

Lenses can also be equipped with the lens data mount LDM. The mount contains a chip with the lens table stored inside, so the lens transmits its data to the camera as soon as it is connected. For information on current ring positions, these lenses must be used in combination with controlled lens motors.

CLM screens

The screens for IRIS, FOCUS and ZOOM controlled lens motors all have the same layout. They show the motor type, motor direction and motor torque.

Note: For CLM-2 motors the torque value is greyed out as torque is only active for CLM-3 motors. It can nonetheless be changed in case a CLM-3 motor might be used but is currently not at hand.

In addition, a lens motor calibration can be triggered, either for all lens motors, or only for the one featured in the particular screen.

Note: When starting a motor calibration, make sure each motor's cog wheel is connected properly to the lens. Pay extra attention that no one is close to the motors or holding them. Catching a finger, cloth or anything else on the motor's cog wheel can cause severe body harm as well as damage to the system.

IRIS CLM

![Image of IRIS CLM screen]

Figure 72: Iris CLM screen
Shows status, direction and torque of the CLM connected to the IRIS socket.
Press the IRIS CLM screen button to access the iris CLM screen. This screen shows the type of motor connected to the IRIS socket, its direction and torque. Direction and torque can be changed by the screen buttons below and above the value. The upper left screen button calibrates only the iris motor.
Pressing the lower left screen button starts calibration of all connected lens motors.

**ZOOM CLM**

*Figure 74: Focus CLM screen*
Shows status, direction and torque of the CLM connected to the FOCUS socket.

Press the FOCUS CLM screen button to access the focus CLM screen. This screen shows the type of motor connected to the FOCUS socket, its direction and torque. Direction and torque can be changed by the screen buttons below and above the value. The upper left screen button calibrates only the focus motor.

Pressing the lower left screen button starts calibration of all connected lens motors.

3D Lens Sync

When two cameras are connected and their sensors are synced with via the EXT connectors, the slave camera will receive its motor commands from the master camera. Its radio module switches automatically off. Calibration of lens motors must happen individually for each camera.

15 ALEXA Plus 4:3

The ALEXA Plus 4:3 is identical to an ALEXA Plus except for its ALEV III sensor which has a 4:3 active area. This makes the camera the ideal companion camera to an ALEXA Studio.

Licenses

The ALEXA Plus 4:3 includes a bundle license, which enables DNxHD, High Speed recording and anamorphic desqueeze. The license is pre-installed on the camera and cannot be deleted.

Note: Do not downgrade the camera to a software version before SUP 6.1.

4:3 mode

The ALEXA Studio, ALEXA M and ALEXA Plus 4:3 cameras can be operated in 4:3 mode.

In 4:3 mode, the camera captures images from a vertically extended sensor area. The used area is 23.76 x 17.82mm in size, which translates to 2880 x 2160 sensor pixels.

Note: The sensors of regular ALEXA and ALEXA Plus cameras are not capable of creating a 4:3 image!

Loading 4:3 mode

Go to MENU>System>Sensor mode. The currently loaded mode is shown in the first line.
Press the wheel. To load the new mode, press the two lower screen buttons.

Note: Loading 4:3 or 16:9 mode results in all settings being set to factory reset values!

Frame rate

The maximum sensor frame rate in 4:3 mode is 48 fps.

Recording

SxS recording is only possible with ProRes codecs in 2K (2048x1536) resolution.

External recording is only possible in ARRIRAW with recorders that support ARRIRAW 4:3.

Monitoring

For monitoring, the 4:3 image is downscaled to 958 x 720 pixels for the EVF and 1440 x 1080 for the MON OUT. Only horizontal surround view is available in 4:3 mode. The image is not rescaled for surround view, but horizontally extended. The non-active area of the EVF and MON OUT is filled with black ("pillarboxed").

Anamorphic desqueeze

Both 1.3x and 2x anamorphic desqueeze is available in 4:3 mode. 1.3x anamorphic desqueeze results in an image size of 1280 x 720 for the EVF and 1920 x 1080 for the MON OUT, while 2x desqueeze results in an image size of 1280 x 480 for the EVF and 1920 x 720 for the MON OUT.

4:3 and Highspeed Mode

It is possible to switch from 4:3 to High Speed mode and vice versa. In High Speed mode, only the 16:9 center area of the image sensor is read out.
16 ALEXA Studio

16.1 General Description

The ALEXA Studio extends the features of an ALEXA Plus 4:3 by:

- **Optical viewfinder**
  Brand-new construction from ARRI, featuring optical anamorphic desqueeze, diopter correction, image flip, camera left/right positioning and horizontal distance adjustment

- **Electronic mirror shutter**
  The electronic mirror shutter can be adjusted in a range of 11.2° to 180.0° degrees. When in use, it completely removes rolling shutter effects of the sensor.

- **Built-in motorized ND filter**
  The ND filter has a density of 1.3 and can be moved in and out of the optical path with the push of a button. It is located between the mirror shutter and the image sensor, so the optical viewfinder image is not affected by the filter and stays bright.

16.2 ALEXA Studio Images

*Figure 75: ALEXA Studio right*
Figure 76: ALEXA Studio left

Figure 77: ALEXA Studio top
Figure 78: ALEXA Studio bottom

Figure 79: ALEXA Studio front
16.3 Optics

16.3.1 Electronic Mirror Shutter

The electronic mirror shutter is located between the PL-mount and the image sensor at an angle of about 45°. It is part of the optical reflex viewfinder system in that it reflects the lens image into the optical viewfinder.

It is synchronized with the electronic shutter of the camera sensor so that the sensor is only read out in the dark phase. This completely removes rolling shutter effects of the sensor readout.

Its 180° mirrored surface reflects the lens image into the optical viewfinder. The open sector of the mirror shutter can be reduced through an electronically controlled sector gate. The mirror shutter rotates 360° for every captured frame, controlling the exposure of the sensor through its open sector. The readout of the sensor happens while the mirror reflects the light of the optical path into the optical viewfinder.

The angle of the open sector is electronically controlled via the regular camera controls.
16.3.2 Lens Adapter PL Mount LA-PL-2 (with LDS)

The lens mount of the ALEXA Studio supports the ARRI Lens Data System. The LDS lens must be mounted in the 12 o'clock or 3 o'clock position to enable the LDS functions. Take great care not to harm any elements of the LDS contacts on either lens or camera when attaching or deattaching a lens or lens port cover.

Besides the LDS feature, the same rules as with the LA-PL-1 apply.

Figure 81: ALEXA Studio PL-Mount
Note: Due to the optical mirror shutter, the use of Angenieux Optimo Rouge lenses, any Super16 lenses, or lenses with dimensions not matching the dimensions in the figure "Allowed lens dimensions with mirror shutter" drawing cannot be used with the ALEXA Studio, as they would destroy the rotating mirror shutter!

Figure 82: Allowed lens dimensions with mirror shutter

16.3.3 Optical Viewfinder

The ALEXA Studio has an optical reflex viewfinder system with interchangeable ground glasses.

It offers an exceptional viewing quality favoured by a large optical design. Special care has been taken to avoid the unpleasant vignette effect that could occur by moving the eye.
Note: To use the optical viewfinder, the mirror shutter must be set to On.

The viewfinder is adjustable in two axes, laterally extendable for left eye operation and shows illuminated frame lines (ARRIGLOW).

The viewfinder image stays upright and correct left-to-right when the viewfinder is swivelled within the main axis.

Figure 83: OVF top view, with mounting points marked

Extending the viewfinder arm

- Loosen the straight-structured ring next to the FIX engraving counter-clockwise (contrary to the arrow).
- Adjust the horizontal position.
- Tighten the ring clockwise (with the arrow direction).

Adjust Barrel Friction

- Move the dot-structured ring according to the engravings LOOSE and FRICTION to loosen or tighten the friction of the OVF barrel.

Contrast Filter

To achieve a temporary subjective reduction of viewfinder contrast range, a contrast filter (density 0.6) can be pivoted into the optical beam path.

- Use the lever next to the level bubble to pivot the contrast filter into the optical path.
- Releasing the lever pivots the contrast filter back out of the optical path.
Ground glasses

The ground glass is the equivalent to the image sensor for the optical viewfinder. The image created by the lens is projected to the ground glass, from where it is picked up by the optical viewfinder.

Ground glasses contain frame and format markings to show the recorded image area and the area of interest. The sensor aperture of the ALEXA Studio is different from the camera aperture of ANSI and DIN Super35 formats. Therefore, Super35 ground glasses of the ARRICAM system do not provide exact frame markings in the ALEXA Studio viewfinder image. For exact framing, use only ground glasses made specifically for the ALEXA Studio.

To exchange a ground glass:

- Press the VIEW button so that the sensor is protected by the mirror shutter.
- Turn off the camera and disconnect it from power supply.
- Remove the lens or protective cap.
- Screw the ARRI Ground Glass Puller into the ground glass.
- Carefully pull out the ground glass.
- Check that the new ground glass and the ground glass holder are clean.
- Screw the ARRI Ground Glass Puller into the new ground glass and push it into the holder.
- Make sure the ground glass is inserted completely and correctly locked in place.
- Attach a lens or a protective cap to the lens mount.

Figure 84: Ground glass in camera with Ground Glass Puller attached
To remove the field lens, which is located above the ground glass:

- Remove the ground glass first
- Screw the ARRI Ground Glass Puller into the field lens
- Carefully pull out the field lens
Note: Due to the risk of displacement caused by shock force, we recommend to remove both ground glass and field lens before transportation and shipping of the camera. Whenever removing the camera from its case, check that both ground glass and field lens are properly seated before switching on the camera to prevent any damage to the mirror shutter.

ARRIGLOW

The ARRIGLOW module is integrated in the optical viewfinder system of the ALEXA Studio. It allows illuminated format markings to be superimposed onto the viewfinder image with adjustable brightness.

- Press the buttons on the left side of the OVF below the DIMMER engravement to adjust the brightness of the ARRIGLOW. At its lowest brightness setting, the ARRIGLOW is switched off.
- The ARRIGLOW color is set in the camera menu under MENU>Monitoring>Frame lines> Frame lines color

![Figure 88: ARRIGLOW buttons](image)

Changing the ARRIGLOW mask

The ground glass used for the optical viewfinder should be combined with a matching glow mask. To change the glow mask:

- Loosen the 3mm allen screw next to the level bubble.
- Remove the level bubble element.
- Grab the glow mask with a Hirschmann clamp at the forceps hole and pull it out of the glow mask frame.
- Check that both the new glow mask and the glow mask frame are clean.
- Carefully push the new glow mask into the glow mask frame.
- Make sure the glow mask is inserted completely.
- Place the bubble element on top of the ARRIGLOW module and tighten the 3mm allen screw.
- Turn on the ARRIGLOW and check that ground glass and glow mask are correctly aligned.

![Figure 89: Glow mask slot](image)

**Anamorphic Desqueeze**

- Turn the wheel on top of the OVF ball element to swing the anamorphic desqueeze element into the optical path.
- *Note: By default, the anamorphic element is for 2x anamorphic lenses. It can be changed to an element for 1.3x anamorphic lenses.*

**Image Flip**

- Press the button next to the image flip symbol.
- Turn the knob next to the image flip symbol until the image is fully flipped.
- To undo the flip, rotate the knob until the button jumps out and the knob is locked again.

**Diopter Adjustment**

- *Note: Depends on the eyepiece in use. Description for default eye piece of ALEXA Studio.*
- Turn the eyepiece barrel until the ground glass is in focus.
- A neutral, unstructured, bright out-of-focus image content helps with this.
Attaching the optical viewfinder

Upon delivery, the OVF is not connected to the camera and must be installed by the user.

- Remove the protective cover from the OVF by loosening its 2x 3mm allen screws.
- Remove the blinding plate from the camera by loosening its 2x 3mm allen screws.
- Place the OVF on the camera.
- Take special care that the electronic connectors of camera and viewfinder are connected before pushing the OVF in place.
- Tighten the 3x 3mm allen screws of the OVF (See OVF top view image for locations of screws).

Note: The torx screws on the camera that are painted red may not be tightened or loosened, as this would corrupt the alignment of the OVF.

Figure 90: OVF with cover plate

Figure 91: Alexa Studio with cover plate
Swapping the optical viewfinder for an electronic viewfinder EVF-1

- Make sure the camera is powered down.
- Loosen the 3x 3mm hex screws of the OVF completely (See OVF top view image for locations of screws).
- Remove the optical viewfinder.
- Place the EVA-1 electronic viewfinder adapter plate where the optical viewfinder was.
- Tighten the 2x 3mm hex screws.
- Attach the EVF mounting bracket with the EVF-1 to the camera housing with its 2x 3mm allen screws.
- Connect the EVF cable to the camera.
- Power the camera.

Figure 92: Electronic viewfinder adapter EVA-1

Figure 93: ALEXA Studio with mounted EVF-1
16.3.4 ND Filter

The ALEXA Studio has a ND filter in front of the sensor, which can be moved in and out of the optical path. The motorized filter slider contains a ND filter with a density of 1.3, and a cover glass without additional density. The filter slider is sealed, so that no dirt or dust can enter the area between the slider and the sensor.

Note: Perform regular dust checks on the outside of the ND filter slider, as dust that might collect on top of it. As the slider is very close to the sensor, dust or dirt collecting on it might be visible as artifacts in images.

When performing a dust check, make sure the camera is switched off and disconnected from any power source to prevent the mirror shutter from activation during the cleaning process.

The ND filter can be activated in the EI screen by pushing the lower right screen button.

![Figure 94: EI screen](image)

If activated, the ASA rating in the Homescreen will have an ND index next to it.

![Homescreen with ND filter activated](image)

Note: The use of the internal ND filter has no influence on the EI rating of the camera. When measuring exposure with a light meter, take into account the light loss of 4 1/3 stops generated by the ND filter.
16.4 Studio Camera Controls

Only a few additional controls are available on the ALEXA Studio. These are used to control the mirror shutter and the ND filter.

The Homescreen has icons for the active ND filter and the mirror shutter position and state.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ND</td>
<td>ND filter is active</td>
</tr>
<tr>
<td>G</td>
<td>Mirror is on &amp; parked in gate position (Grey icon if mirror shutter is switched off)</td>
</tr>
<tr>
<td>V</td>
<td>Mirror is on &amp; parked in view position (Grey icon if mirror shutter is switched off)</td>
</tr>
<tr>
<td>MS</td>
<td>Mirror shutter is running</td>
</tr>
</tbody>
</table>

**ND filter activation**

- In the Homescreen, press EI.
- In the EI screen, press the lower right screen button labeled ND FILTER to move the ND filter in and out of the optical path.

![Figure 95: EI screen](image)

**Mirror shutter activation**

- In the Homescreen, press SHUTTER.
- In the Shutter screen, press the lower right screen button labeled MIRROR to activate or deactivate the mirror shutter.

![Shutter screen](image)

**Note:** When mirror shutter is active, the shutter angle is limited to 180.0 degrees. Frame rates higher than 37 fps for 4:3 and higher than 46 fps for 16:9 reduce the shutter angle range further!

**Note:** For frame rates higher than 30 fps, it is recommended to use a power source with a voltage level of 18-35 V to ensure the mirror shutter is powered sufficiently!
MIRROR PARK buttons VIEW and GATE

The camera left side Operator Controls have two additional function buttons labelled VIEW and GATE. These buttons control the parking position of the mirror shutter.

A spinning mirror shutter can be stopped by pressing either of the two buttons. Pressing the VIEW button will park the mirror in the optical path, enabling a live preview in the optical viewfinder.

Pressing the GATE button will stop the mirror shutter out of the optical path, enabling a live preview on the MON OUT and the REC OUT, and the EVF in case it is mounted to the camera. Each button is accompanied by a blue LED that lights when the mirror is parked in the respective position. When the mirror shutter is running, both of the LEDs will be active.

Pressing the GATE button while the mirror is parked in the VIEW position will move the mirror shutter by 180.0° degrees into the GATE position.

Pressing the VIEW button while the mirror is parked in the GATE position will move the mirror shutter by 180.0° degrees into the VIEW position.

To restart the mirror shutter, press both VIEW and GATE simultaneously.

Note: After booting the camera, the mirror shutter is parked in the GATE position for safety reasons.

When stopping, the mirror shutter always opens up the electronic sector gate to 180.0°, and closes down when it is restarted.

A live image on EVF, MON OUT and REC OUT is available when the mirror shutter is spinning or parked in the GATE position. A parked mirror shutter will automatically start spinning when recording is started.

When the mirror shutter is switched off, it is parked in the GATE position.

Note: For safety reasons, it is required to power down the camera before performing a "gate check". Do not check or clean the sensor cover glass while the camera is powered up and the mirror is parked in the GATE position!

Frame rate and shutter angle with mirror shutter on

When the mirror shutter is switched on, the sensor frame rate is limited to 60 fps in 16:9 and 48 fps in 4:3.

Frame rates higher than 37 fps in 4:3 or 46 fps in 16:9 reduce the maximum possible mirror shutter angle. When the frame rate change reduces the allowed mirror shutter angle below the currently active shutter angle, the camera automatically sets the shutter angle to 135.0°. The technically possible maximum shutter angle depends on the frame rate. To achieve the maximum possible shutter angle:

- Press the SHUTTER button in the Homescreen to get to the Shutter list screen.
Press the ADD button in the Shutter list screen to get to the Shutter angle screen.  
Press the MAX button in the Shutter Angle screen and confirm by pressing the jogwheel twice.  
The maximum possible shutter angle is now a part of the shutter list and can be set by pressing the jogwheel.

When the mirror shutter is on, the camera redirects the user to the Shutter list screen after setting the sensor frame rate, where the shutter angle can be adjusted as desired. To cancel this action, press the HOME button.

### 16.5 4:3 Mode

The ALEXA Studio, ALEXA M and ALEXA Plus 4:3 cameras can be operated in 4:3 mode.  
In 4:3 mode, the camera captures images from a vertically extended sensor area. The used area is 23.76 x 17.82mm in size, which translates to 2880 x 2160 sensor pixels.

### Loading 4:3 mode

Go to MENU>System>Sensor mode. The currently loaded mode is shown in the first line.  
Press the wheel. To load the new mode, press the two lower screen buttons.  

Note: Loading 4:3 or 16:9 mode results in all settings being set to factory reset values!

### Frame rate

The maximum sensor frame rate in 4:3 is 48 fps.

### Recording

**SxS** recording is only possible with ProRes codecs in 2K (2048x1536) resolution.  
External recording is only possible in ARRIRAW with recorders that support ARRIRAW 4:3.
Monitoring

For monitoring, the 4:3 image is downscaled to 960 x 720 pixels for the EVF and 1440 x 1080 for the MON OUT. Only horizontal surround view is available in 4:3 mode. The image is not rescaled for surround view, but horizontally extended. The non-active area of the EVF and MON OUT is filled with black ("pillarboxed”).

Anamorphic desqueeze

Both 1.3x and 2x anamorphic desqueeze is available in 4:3 mode. 1.3x anamorphic desqueeze results in an image size of 1280 x 720 for the EVF and 1920 x 1080 for the MON OUT, while 2x desqueeze results in an image size of 1280 x 480 for the EVF and 1920 x 720 for the MON OUT.

For the optical viewfinder, anamorphic desqueeze can be achieved by flipping an anamorphic element into the optical path. By default, the OVF has an optical element for 2x desqueeze. Elements for 1.3x desqueeze are also available.

4:3 and Highspeed Mode

It is possible to switch from 4:3 to High Speed mode and vice versa. In High Speed mode, only the 16:9 center area of the image sensor is read out.

16.6 Licensed Features

Licensed features DNxHD, High Speed mode and Anamorphic Desqueeze are automatically enabled in the ALEXA Studio.
17 ALEXA M

17.1 General Description

The ALEXA M is a specialty camera where the camera body is split into two parts. The camera head contains the image sensor, while the backend contains the image processing modules. Both parts are connected via a fibre interface.

The advantages of this system are:

- Better access to small spaces where a regular ALEXA would not fit into
- Lighter handheld operation.
- Lighter and smaller setups on 3D rigs
- Easy camera operability when the camera head cannot be accessed, e.g. a camera crane or a helicopter rig.
17.2 ALEXA M Images
Figure 96: ALEXA M Backend left side
Figure 97: ALEXA M Backend right side
17.3 ALEXA M Camera Head

The ALEXA M camera head contains the image sensor and parts of the image processing. Images are transmitted to the Backend via fibre cable. The fibre connection is bi-directional and returns the EVF image to the camera head from the Backend.
Due to the fibre connection, the ALEXA M has an increased power draw of approximately 120W, with the head drawing 40W. The head can be powered from the backend with hybrid fibre cables of up to 30m length.

Note: When powering the head from the backend, power supplies with at least 24V output must be used, due to the voltage drop over the hybrid cable.

The head can also be powered directly through its BAT connector, if the battery delivers at least 40W of power.

17.3.1 CCH-2

The Camera Center Handle 2 CCH-2 is the handle for the ALEXA M camera head. It is mounted with 4x 3mm allen screws and can be attached either to the top or the bottom of the camera head.

Figure 98: CCH-2 mounted on ALEXA M camera head

Note: The CCH-2 only fits the ALEXA M camera head and not the ALEXA M backend or any other ALEXA camera.

17.4 ALEXA M Camera Backend

The ALEXA M camera backend contains the main controls, image processing, output and recording. It behaves like any regular ALEXA, only that it lacks the operator controls and is slightly longer.
17.5 Fibre Connection

![SMPTE 311 optical fibre connectors](image)

Figure 99: SMPTE 311 optical fibre connectors

The ALEXA M utilizes SMPTE 311 fibre connectors and cables. The camera head can be powered with hybrid fibre/power cables with a length of up to 30m, if the backend power supply can deliver 120 W in total.

Note: When powering the camera head from the backend, the power supply must have an output of at least 24V due to a voltage drop over the hybrid cable.

If this is not the case, the head should be powered separately through its BAT connector with a power supply that delivers at least 40W of power.

For regular fibre cable, a signal loss of up to 10 dB is acceptable. 1 km of fibre cable has a signal loss of 0.5 dB, while a fibre connector pair introduces a signal loss of 0.5-2 dB, depending on the amount of dirt on the optical contacts. Typically, a cable length of up to 1 km with 4 connection joints is still acceptable.

To connect the cable to the camera, make sure the cable direction is correct. Line up the red guides and push the cable connector onto the camera connector piece. A clicking sound indicates the connector has locked. Plug the rubber caps of the connectors into each other to protect their inside from dirt.

To disconnect the cable from the camera head, pull on the rubber end of the connector in the direction of the cable. To disconnect the cable from the backend, push the metal ring of the camera connector piece and pull on the cable connector in the opposite direction.
Connect the camera head to the backend via the optical link before powering the camera. Disconnecting the head from the backend during operation requires both parts to be powered down and reconnected before powering up the system again.

![Correctly aligned fibre connectors](image)

**Figure 100: Correctly aligned fibre connectors**

### Cleaning of fibre connectors

Cleaning of the fibre connectors is an important task. Only use cleaning devices certified for SMPTE 311 connectors, like the “IBC M20” which is delivered with the camera package. Never use compressed air or any other uncertified cleaning method, as this could permanently damage or destroy the fibre connectors.

Both dry and wet cleaning tools are available, with the dry cleaners having proved to be more efficient for regular cleaning, while the wet cleaners are better with strong and sticky contaminations.

Regular cleaning of at least one time per day is recommended, as well as any time the signal quality deteriorates.

### Fibre connection status

Next to the fibre connectors of the ALEXA M is a fibre status LED that reflects the signal strength.

A green LED reflects a good signal strength.

If the LED is alternately flashing between green and amber, the signal is weak, which can be caused by dirty connectors, faulty cables, or a bad connection. Power down the camera, clean the connectors, reconnect the cable to the camera and repower the camera in this particular order. If the problem does not go away, swap the cable.

An amber LED indicates a link error. The camera must be rebooted. If the link error reoccurs, follow the steps described for the green/amber flashing LED.
17.6 4:3 Mode

The ALEXA Studio, ALEXA M and ALEXA Plus 4:3 cameras can be operated in 4:3 mode.

In 4:3 mode, the camera captures images from a vertically extended sensor area. The used area is 23.76 x 17.82mm in size, which translates to 2880 x 2160 sensor pixels.

Note: The sensors of regular ALEXA and ALEXA Plus cameras are not capable of creating a 4:3 image!

Loading 4:3 mode

Go to MENU>System>Sensor mode. The currently loaded mode is shown in the first line.

Press the wheel. To load the new mode, press the two lower screen buttons.

Note: Loading 4:3 or 16:9 mode results in all settings being set to factory reset values!

Frame rate

The maximum sensor frame rate in 4:3 is 48 fps.

Recording

SxS recording is only possible with ProRes codecs in 2K (2048x1536) resolution.

External recording is only possible in ARRIRAW with recorders that support ARRIRAW 4:3.

Monitoring

For monitoring, the 4:3 image is downscaled to 960 x 720 pixels for the EVF and 1440 x 1080 for the MON OUT. Only horizontal surround view is available in 4:3 mode. The image is not rescaled for surround view, but horizontally extended. The non-active area of the EVF and MON OUT is filled with black ("pillarboxed").
Anamorphic desqueeze

Both 1.3x and 2x anamorphic desqueeze is available in 4:3 mode. 1.3x anamorphic desqueeze results in an image size of 1280 x 720 for the EVF and 1920 x 1080 for the MON OUT, while 2x desqueeze results in an image size of 1280 x 480 for the EVF and 1920 x 720 for the MON OUT.

4:3 and Highspeed Mode

It is possible to switch from 4:3 to High Speed mode and vice versa. In High Speed mode, only the 16:9 center area of the image sensor is read out.

17.7 Licensed Features

Licensed features SxS High Speed Recording and Anamorphic desqueeze are automatically enabled in the ALEXA M.

17.8 Lens Data System

The ALEXA M is equipped with a LA-PL-2 lens mount with LDS contacts. When using a LDS lens, such as Master Primes or LDS UltraPrimes, the camera reads, displays and records lens metadata.

The LDS screen can be accessed through the menu, which contains an additional item "LDS". This menu item is only available on the ALEXA M.

Note: Lens motors and the lens data archive LDA are not supported by the ALEXA M.
The camera can be remote controlled with an RCU-4. This device mirrors the controls on the camera's right side. It is connected to the camera's Ethernet port. Power is supplied via the Ethernet cable.

Note: The ALEXA M features two ports labeled "ETH" in addition to the Ethernet port. However, these cannot be used for connecting the RCU-4.

To power the RCU-4, press the power button after connecting the device to a camera.

During boot-up, the RCU-4 compares its firmware version with the camera firmware version. If it detects a difference, it will update itself to match the camera's firmware version. When the update is completed, the RCU-4 will shut down automatically.

The power button of the RCU-4 only affects the RCU-4. It is not possible to power or to shut down the camera with the RCU-4. When the camera is powered down, the RCU-4 shuts down automatically as it loses its power supply.

The LOCK button of the RCU-4 locks only the RCU-4. It does not affect the camera lock.

For more info, please refer to the RCU-4 user manual.

A.3 False Color Display

The false color display is a tool to check correct exposure. It can be activated in the EVF and the MON OUT image. When active, the image is turned into a greyscale image with important luminance ranges shown in signal colors.

Color Encoding

Six different colors are used to show the important luminance ranges.

Figure 102: False Color Encoding

The following example illustrates the behavior of the false color display.

Figure 103: Night scene captured with ALEXA

Figure 104: Night scene with false color active
A.4 Info Messages and Warnings

If anything unwanted occurs in the camera, it will give a message to the user.

These states, that require attention from the user, are indicated by icons in the main display, the viewfinder and the MON OUT.

Warnings are message that inform the user that a state has changed or that an error might occur soon. Anyway, recording is still possible.

If the camera goes into error state, recording is no longer possible, as it cannot be guaranteed that images are acquired as the user intended, or recording is simply not possible.

The messages give a compact info what has happened. If more information is required, please refer to the following tables.

Special warnings and errors: Sensor temperature

ALEXA has a Peltier element that keeps the image sensor at a stable temperature. This is important to achieve constant image quality. Under some occasions, the camera might not be able to keep this temperature, or it might take some time to reach the correct level. This can be the case right after booting, or with very hot or cold ambient temperatures.

A red temperature icon indicates that the sensor temperature is too far off to guarantee a high image quality, while a white temperature icon indicates that image quality is still in the (very high set) quality limits required by ARRI.

The related messages in the INFO screen are shown in the following tables.

ALEXA status message

System state: Good Camera works properly.

ALEXA warning messages and meanings

<table>
<thead>
<tr>
<th>Warning message</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Main Bat: Power warning</td>
<td>The battery attached to the BAT connector has reached its warning level. Battery power is about to end, and a replacement battery should be prepared.</td>
</tr>
<tr>
<td>Onboard Bat: Power warning</td>
<td>The battery attached to the onboard battery adapter has reached its warning level. Battery power is about to end, and a replacement battery should be prepared.</td>
</tr>
<tr>
<td>Card 1: Low capacity</td>
<td>The SxS PRO card in slot 1 has less than 3 minutes recording time left. Prepare a new card for recording.</td>
</tr>
<tr>
<td>Card 2: Low capacity</td>
<td>The SxS PRO card in slot 2 has less than 3 minutes recording time left. Prepare a new card for recording.</td>

<td>A problem with playback occurred. Camera had to abort playback.</td>
</tr>
<tr>
<td>Card removed! Playback failed!</td>
<td>Camera had to abort playback, as SxS card was removed.</td>
</tr>
<tr>
<td>Calibrate lens motors!</td>
<td>New lens motors are attached to the camera. Prior to use they must be calibrated.</td>
</tr>
<tr>
<td>Temperature at limit. Fan RPM raised.</td>
<td>With camera fan is in &quot;Rec low&quot; mode, fan noise might exceed silent level because camera is becoming too hot.</td>
</tr>
<tr>
<td>Master/slave: Focus unit mismatch</td>
<td>With ALEXA Plus and 3D lens sync, both cameras must have the same focus unit activated, which is not the case here.</td>
</tr>
<tr>
<td>Slave: No lens table active.</td>
<td>With ALEXA Plus and 3D lens sync, select lens table on slave when using LDA.</td>
</tr>
<tr>
<td>REC OUT: Switch on Vari flag!</td>
<td>When SxS recording is off and sensor fps does not match REC OUT fps, switch on Vari flag to prohibit duplicate frames.</td>
</tr>
<tr>
<td>Tropical mode active</td>
<td>Reminder for active tropical mode</td>
</tr>
<tr>
<td>REC OUT: Switch on Vari flag!</td>
<td>Issued when SxS is switched on and sensor fps is bigger than project fps.</td>
</tr>
<tr>
<td>ND filter stuck.</td>
<td>ALEXA Studio only. ND filter slider has mechanical problems.</td>
</tr>
<tr>
<td>Mirror sector problem.</td>
<td>ALEXA Studio only. Mirror sector has mechanical problems.</td>
</tr>
<tr>
<td>Mirror cannot reach sync speed.</td>
<td>ALEXA Studio only. Mirror cannot reach speed due to technical problems.</td>
</tr>
<tr>
<td>Voltage too low for mirror!</td>
<td>ALEXA Studio only. Power supply voltage level insufficient to drive mirror shutter.</td>
</tr>
<tr>
<td>Mirror out of phase</td>
<td>ALEXA Studio only. Mirror shutter and sensor are out of phase, may result in exposure artifacts.</td>
</tr>
</tbody>
</table>
Some buttons are defect.  
Camera button signals are failing. Reboot camera. If reappearing after reboot, contact service for button replacement. Mostly hardware problem.

SxS: Check last clip. Low data rate!  
Data rate of last recorded clip is very low. Check for artifacts in replay. Can also occur when forgetting to remove lens cap during recording.

Loading highspeed mode  
While High Speed Mode is loading, the camera functionality is limited. Wait until High Speed mode loading has finished.

LDS failure, restart camera.  
The lens data system has failed. Restart the camera if LDS is used.

M head: Clean fibre connection  
The fibre signal quality of the ALEXA M camera is insufficient and requires cleaning of the connections.

M head: Power warning  
The power level on the ALEXA M camera head is insufficient. Use a power source with a power supply of at least 40 W.

M head: High temperature  
The temperature of the camera head is too high. Apply additional cooling to prevent automatic shutdown.

M head: Low fan speed  
The fan of the ALEXA M camera head cannot reach a sufficient cooling speed. Fan might have to be cleaned or replaced.

ALEXA error messages and meanings

Main Bat: Low power  
The battery attached to the BAT connector has reached its low level (10% below warning level). Battery must be replaced.

Onboard Bat: Low power  
The onboard battery has reached its low level (10% below warning level). Battery must be replaced.

All Bats: Low power  
Batteries on both BAT connector and onboard battery(s) have to be replaced.

Card 1: End of lifetime  
The SxS PRO card in slot 1 has reached the end of its life cycle and has become read-only. Use a new card.

Card 2: End of lifetime  
The SxS PRO card in slot 2 has reached the end of its life cycle and has become read-only. Use a new card.
