Overwhelming complexity of substances \rightarrow smaller set of atoms Overwhelming complexity of atoms \rightarrow electronic structure, nuclei What you're made of

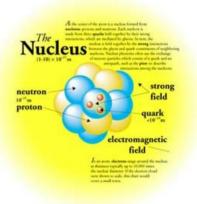

Overwhelming complexity of particles and forces \rightarrow fundamental particles "matter" and "forces": both are particles (different kinds)

What you're made of

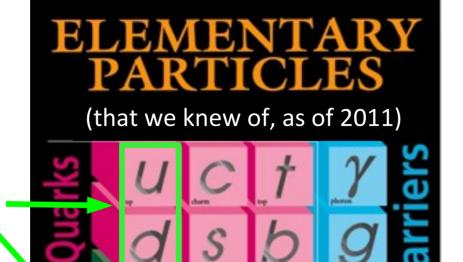

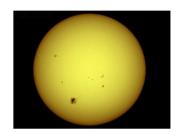

Peter Onyisi

Gluon Particle of the strong nuclear force

What you're made of

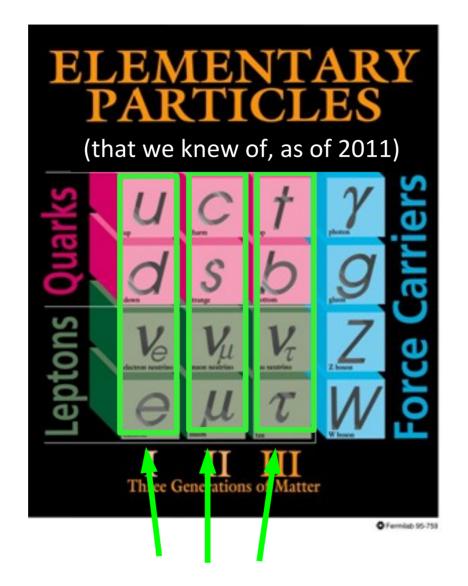

W and Z Particles of the weak nuclear force

O Fermilab 95-750

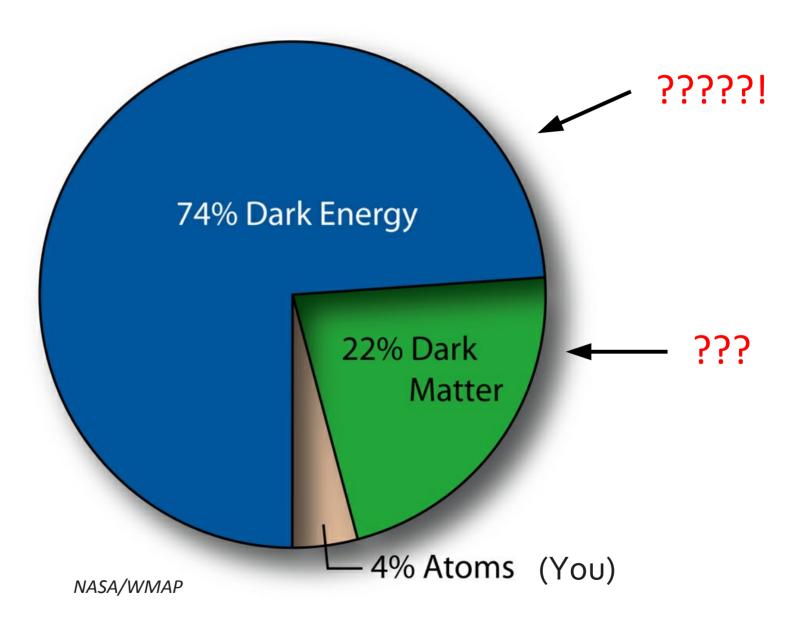

Three Generations of Matter

Three "generations" of matter particles Units of energy and mass 1 GeV = 1.07 protons 125 GeV ≈ 1 cesium atom

30 Oct 2012

The Modern Universe

What does the Higgs boson do?

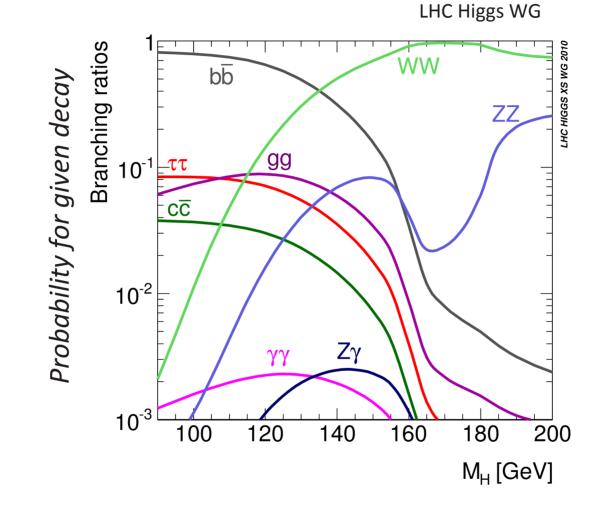

The Higgs *field* fills all of space. It's like a gravitational or electric field, but it doesn't need a source to exist; it's just there.

It gives masses to all the fundamental particles that we know of, essentially by sticking to them.

How can we see it? By shaking the field a bit and seeing the wobbles.

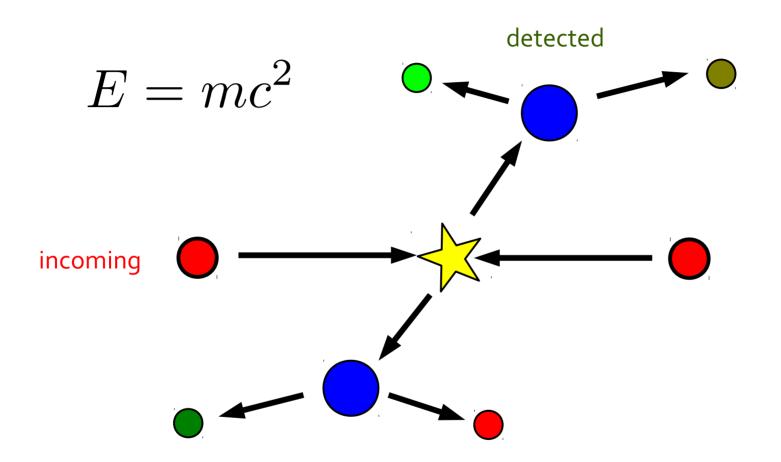

Theoretically well understood

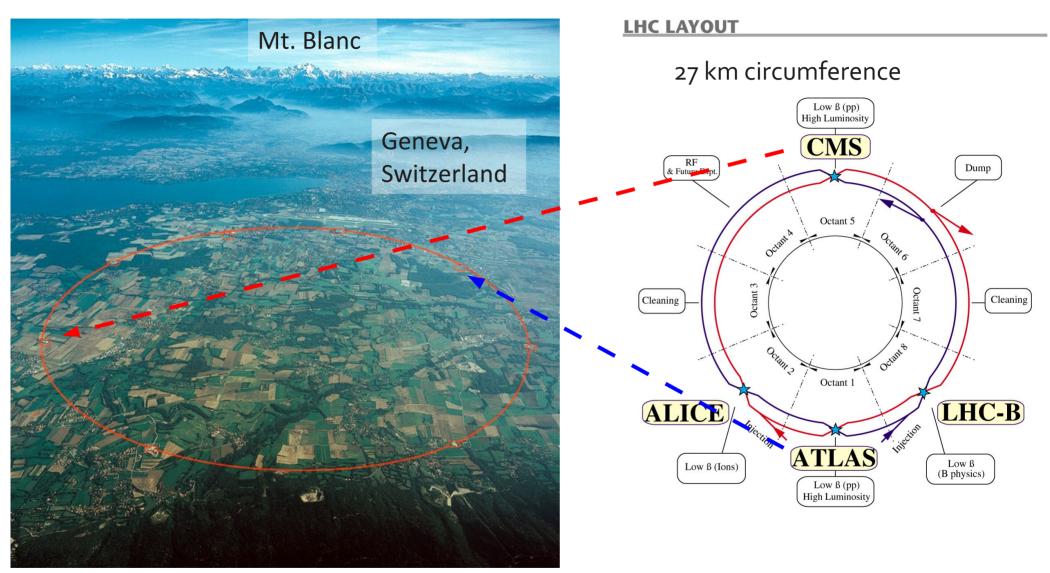

We knew exactly what to look for (except how heavy it was!)

How do we look for new particles?

convert kinetic energy to mass energy of new particles

the particles you can make are determined by the forces they feel

CERN AC _ EI2-4A_ V18/9/1997

CERN: the European laboratory for particle physics **LHC**: collides protons with kinetic energy > 4000 times their rest mass

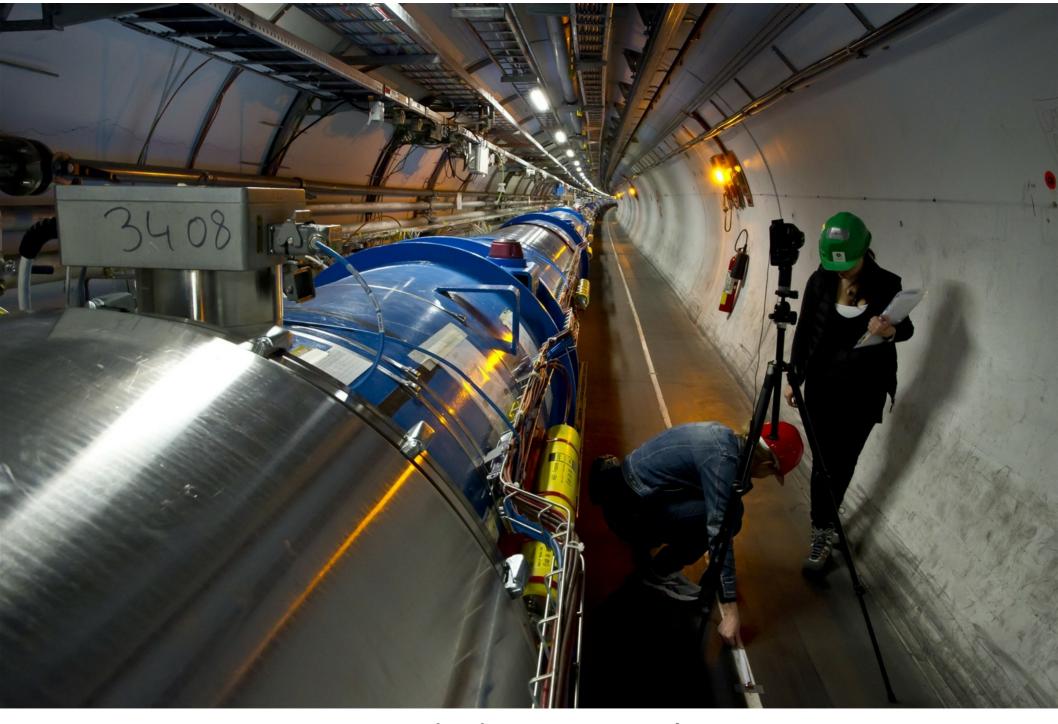

30 Oct 2012

Peter Onyisi

where it all begins

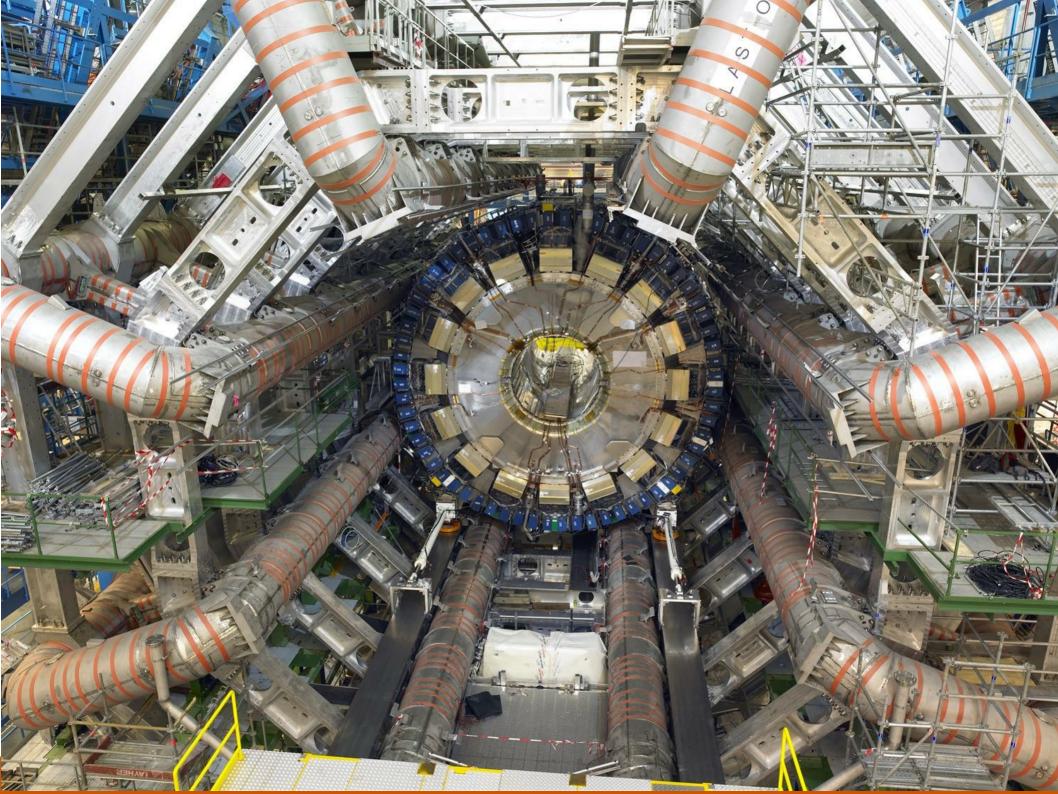

consumption per day ≈ 2 nanograms

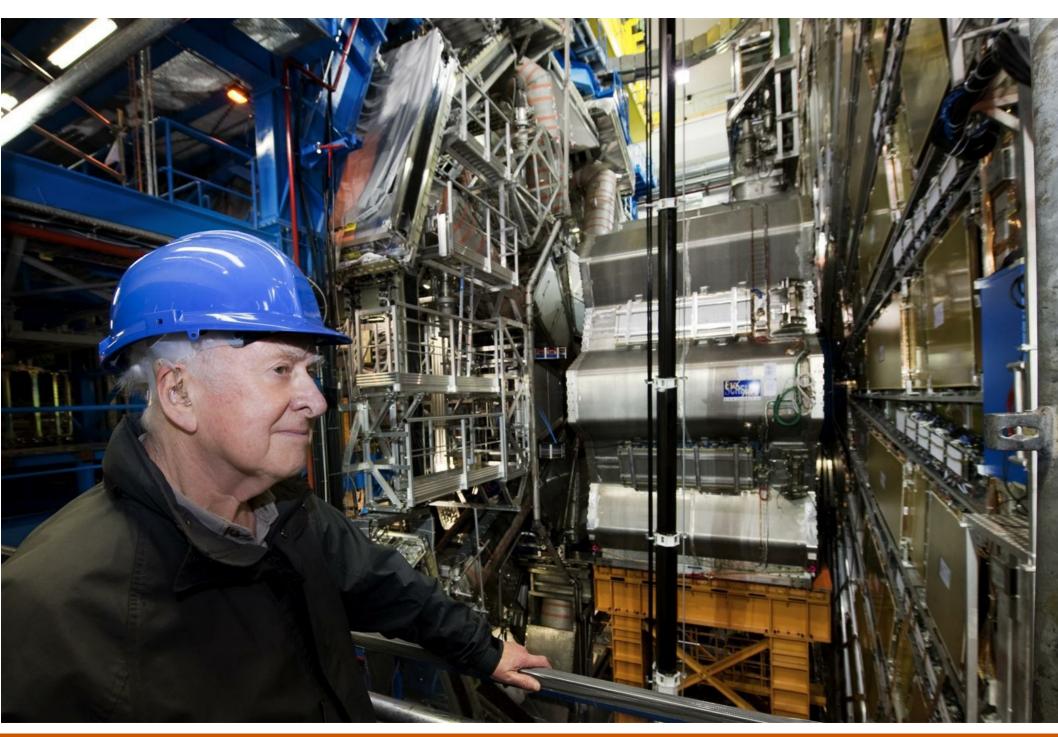

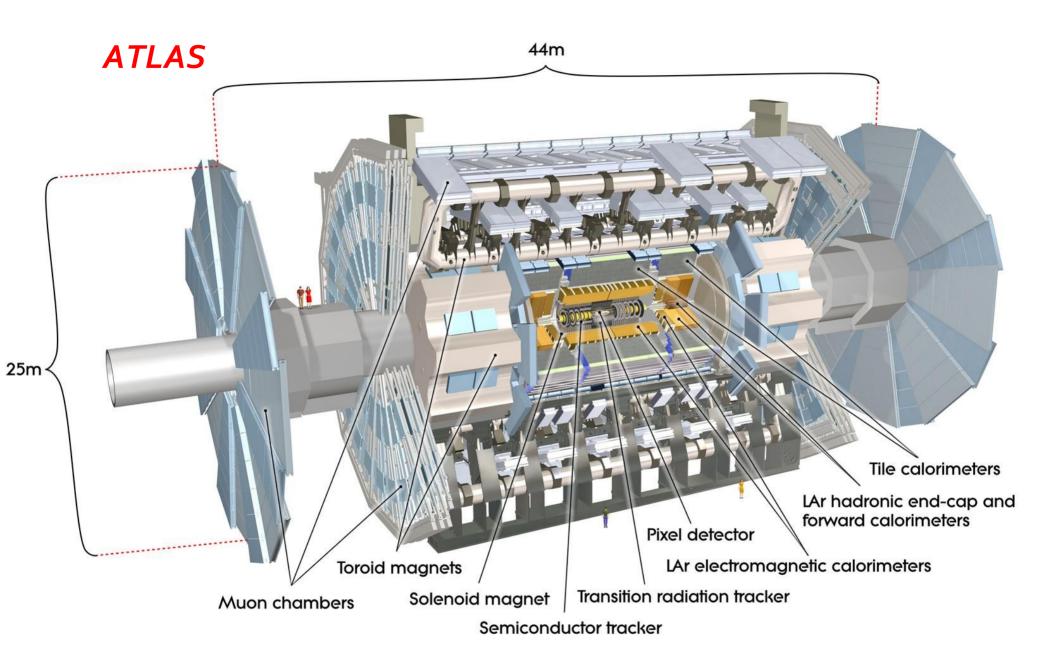

Inside the LHC tunnel

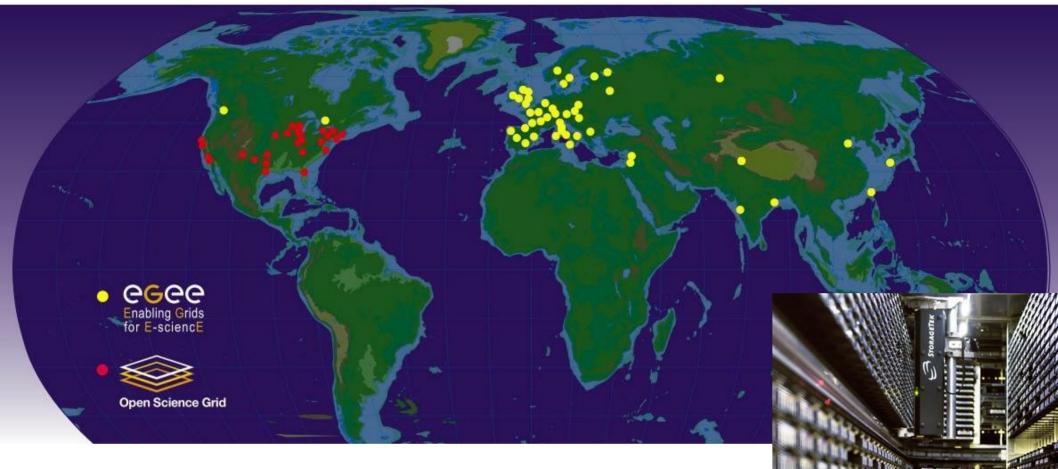

How ATLAS detects particles

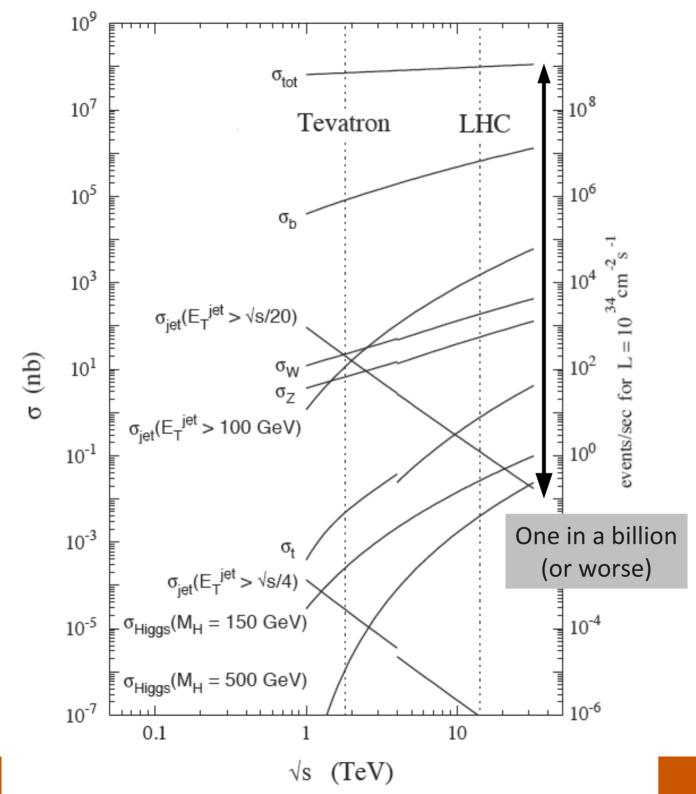

Over 3000 people work on ATLAS... here are a few (at the Higgs party!)

LHC experiments record billions of collisions, tens of petabytes of data per year

Need to search through them with computers throughout the globe

Quantum mechanics: We only have *probabilities*

Every collision is a *random occurrence*

We're looking for things happening less often than once in a trillion collisions

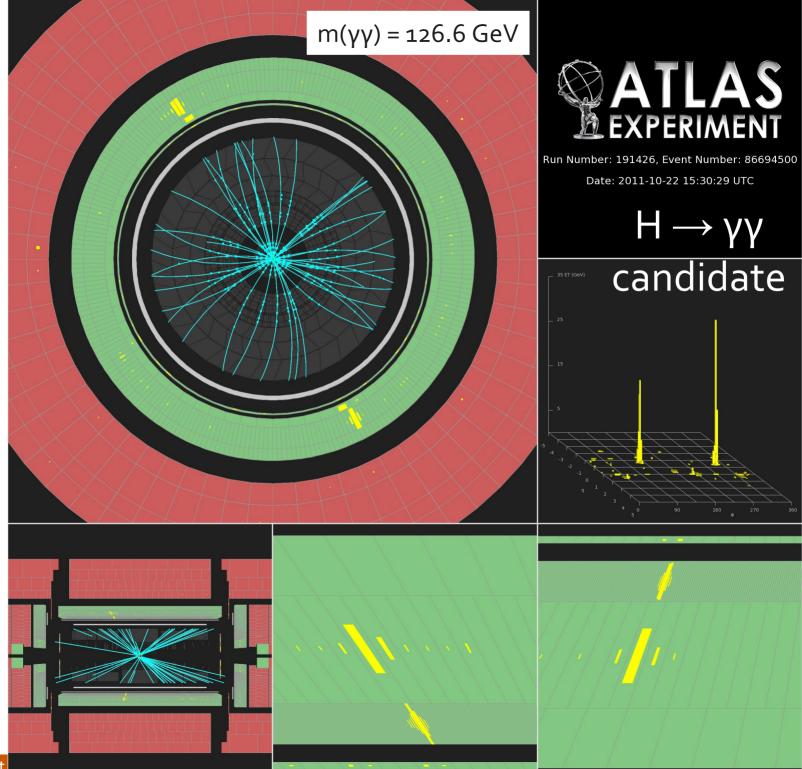

The Pace of Higgses

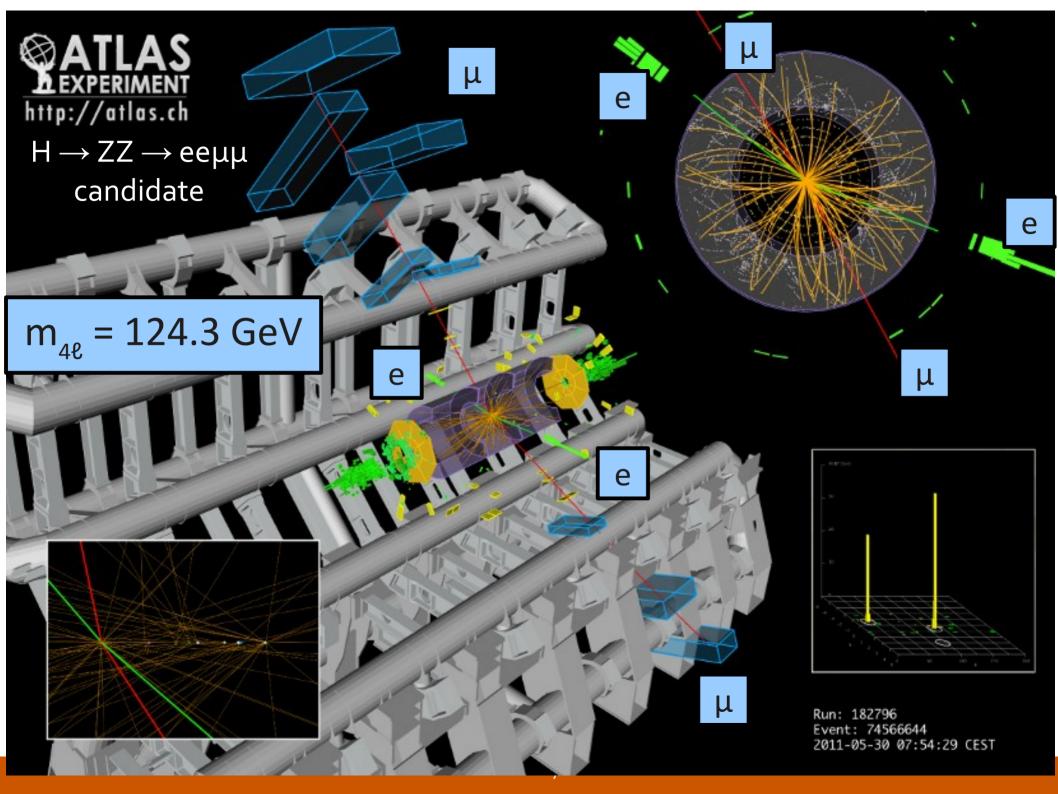

The collisions produce

- $a H \rightarrow WW \rightarrow \ell \nu \ell \nu$ event every 20 minutes
- a H $\rightarrow \gamma \gamma$ event every 45 minutes
- $a H \rightarrow ZZ \rightarrow 4\ell$ event every 13 hours

We're not 100% efficient at catching them, and we need a lot to separate them from other processes

In short, it takes a long time to accumulate data.

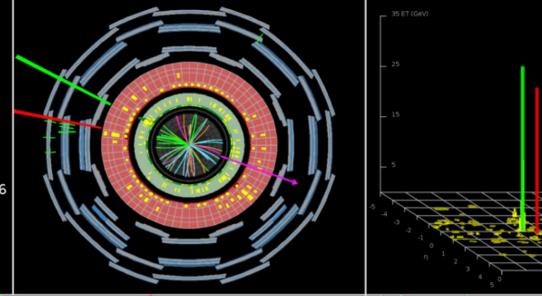

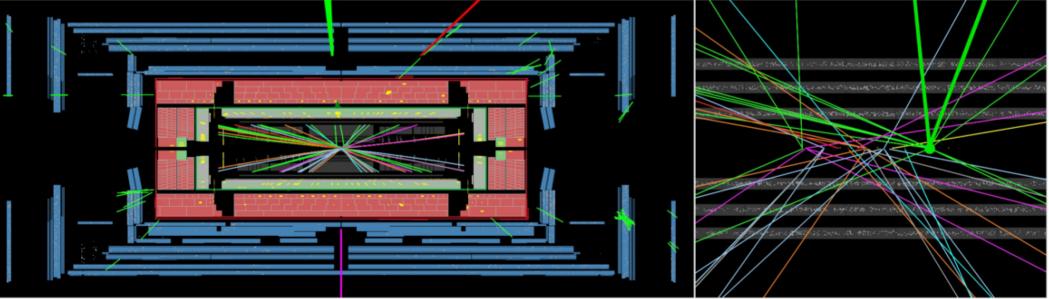

Run Number: 204026, Event Number: 33133446

Towards the Future

What else do we need to study about the Higgs?

- Is it "the" Higgs, or something that just looks like it? Study its behavior!
- Does it have partners? Many theories predict so!
- What, precisely, is its own mass? Is our picture of how the Higgs field comes to be correct?
- Does it have implications for the evolution of the universe?

Is our vacuum stable?

30 Oct 2012

Peter Onyisi

Unsolved Mysteries

There are questions that may be related to new forces and matter particles with mass around the TeV scale.

- What about dark matter?
- The Higgs mass is "unstable" in the Standard Model (very sensitive to initial theoretical parameters) – does something stabilize it? (e.g. "supersymmetry", "composite Higgs")
- Are there differences between matter and antimatter beyond those in the Standard Model?

Also, keep our eyes open for something unexpected!

HIGGS BOSON
