Project Management Methodology

To better meet customer expectations, improve the quality and delivery of service, and continue building trust across campus, ITS Applications provides a project management framework for efforts that are over 80 hours. The project management methodology describes a consistent process and set of document templates for planning, executing and tracking IT projects. The framework is provided as a foundation and guideline, and a primary purpose of the templates and framework is to stimulate a thorough consideration of factors which may affect the work. As projects vary in size, scope, and complexity, project leads are expected to determine when a given template or template section may not apply to the effort at hand.

The project management methodology has several phases, each of which has supporting documents to help with planning and execution. These are living documents and are meant to be updated as needed during the course of a project; in fact, each project phase includes updating the documents from the previous phase.
