

Adobe Premiere Pro - Adjusting Audio and Pan with Keyframing

Use the Selection Tool (v) to select track in timeline

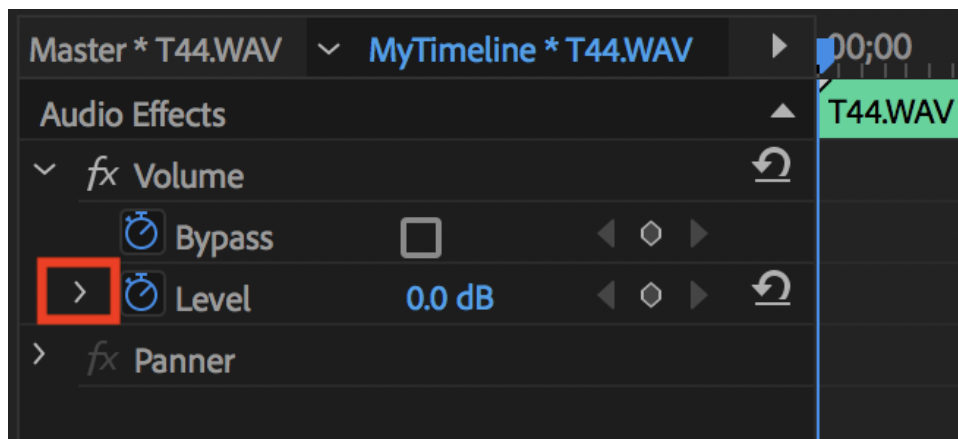

*If you need to delete the track and replace it, just select the track and press delete on your keyboard

Go to the Effect Controls tab

Click on the Level drop down to change volume

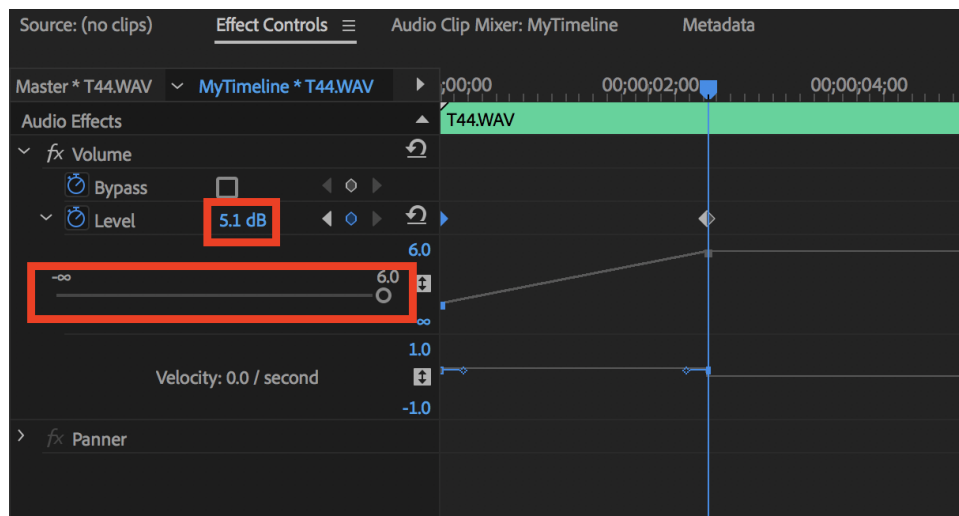

You can control the volume over time in a clip. In other words, you can have the volume increase and decrease as the clip plays.

Do any of the following:

- Enter a value for the level. A negative value decreases the volume level and a positive value increases the volume level. A value of 0.0 represents the original clip's volume level without adjustment.
- Click the triangle next to Level to expand the effect options, and then use the slider to adjust the volume level.

A keyframe is automatically created at the beginning of the clip's timeline in the Effect Controls panel.

To change the pan, in the Effect Controls tab, click the drop down arrow to the left of Panner. Here you can alter the values and add keyframes similarly to the Levels tab.
