Setup Scanner for Remote Administration

This workflow sets up a Scanner for classroom and lab computer administration.

This workflow uses Apple Remote Desktop as an example, but can also be completed using LanDesk.

Select New list > Scanner

Name the Scanner after the Subnet you will be searching. This example is 'CMA Subnet'.

Open the webpage Moody Labs Assigned IPs.

Set the scanner to a network range.

Consulting the Assigned IPs page, enter the beginning of the IP range into the scanner.

Now enter the end of the IP range. This is the last IP number on the Assigned IP page.

Push the refresh button to make the scanner scan.
